[27192] Another function of VGAM656 is therefore inhibition of LOC203378 (Accession XM\_117541). Accordingly, utilities of VGAM656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203378. LOC255624 (Accession XM\_170531) is another VGAM656 host target gene. LOC255624 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by LOC255624, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255624 BINDING SITE, designated SEQ ID:45350, to the nucleotide sequence of VGAM656 RNA, herein designated VGAM RNA, also designated SEQ ID:3367.

[27193] Another function of VGAM656 is therefore inhibition of LOC255624 (Accession XM\_170531). Accordingly, utilities of VGAM656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255624. LOC256544 (Accession XM\_171228) is another VGAM656 host target gene. LOC256544 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC256544, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256544 BINDING SITE, designated SEQ ID:46016, to the nucleotide sequence of VGAM656 RNA, herein designated VGAM RNA, also designated SEQ ID:3367.

[27194] Another function of VGAM656 is therefore inhibition of LOC256544 (Accession XM\_171228). Accordingly, utilities

of VGAM656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256544. LOC91151 (Accession NM\_033208) is another VGAM656 host target gene. LOC91151 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC91151, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91151 BINDING SITE, designated SEQ ID:27052, to the nucleotide sequence of VGAM656 RNA, herein designated VGAM RNA, also designated SEQ ID:3367.

[27195] Another function of VGAM656 is therefore inhibition of LOC91151 (Accession NM\_033208). Accordingly, utilities of VGAM656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91151. LOC92492 (Accession XM\_045396) is another VGAM656 host target gene. LOC92492 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC92492, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC92492 BINDING SITE, designated SEQ ID:34454, to the nucleotide sequence of VGAM656 RNA, herein designated VGAM RNA, also designated SEQ ID:3367.

[27196] Another function of VGAM656 is therefore inhibition of LOC92492 (Accession XM\_045396). Accordingly, utilities of VGAM656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92492. LOC92573 (Accession XM\_045884) is another VGAM656 host target gene. LOC92573 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92573, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92573 BINDING SITE, designated SEQ ID:34594, to the nucleotide sequence of VGAM656 RNA, herein designated VGAM RNA, also designated SEQ ID:3367.

[27197] Another function of VGAM656 is therefore inhibition of LOC92573 (Accession XM\_045884). Accordingly, utilities of VGAM656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92573. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 657 (VGAM657) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27198] VGAM657 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM657 was detected is described hereinabove with reference to Figs. 1–8.

[27199] VGAM657 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid Herpesvirus 1. VGAM657 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27200] VGAM657 gene encodes a VGAM657 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM657 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM657 precursor RNA is designated SEQ ID:643, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:643 is located at position 75089 relative to the genome of Me–

leagrid Herpesvirus 1.

[27201] VGAM657 precursor RNA folds onto itself, forming VGAM657 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27202] An enzyme complex designated DICER COMPLEX, `dices` the VGAM657 folded precursor RNA into VGAM657 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM657 RNA is designated SEQ ID:3368, and is provided hereinbelow with reference to the sequence listing part.

[27203] VGAM657 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM657 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM657 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[27204] VGAM657 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM657 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM657 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM657 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM657 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[27205] The complementary binding of VGAM657 RNA, herein designated VGAM RNA, to host target binding sites on VGAM657 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM657 host target RNA into VGAM657 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27206] It is appreciated that VGAM657 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM657 host target genes. The mRNA of each one of this plurality of VGAM657 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM657 RNA, herein designated VGAM RNA, and which when bound by VGAM657 RNA causes inhibition of translation of respective one or more VGAM657 host target proteins.

[27207] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM657 gene, herein designated VGAM GENE, on one or more VGAM657 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[27208] It is yet further appreciated that a function of VGAM657 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM657 include diagnosis, prevention and treatment of viral infection by Meleagrid Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM657

correlate with, and may be deduced from, the identity of the host target genes which VGAM657 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27209] Nucleotide sequences of the VGAM657 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM657 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM657 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM657 are further described hereinbelow with reference to Table 1.

[27210] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM657 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM657 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27211] As mentioned hereinabove with reference to Fig. 1, a function of VGAM657 gene, herein designated VGAM is inhibition of expression of VGAM657 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM657 correlate with, and may be deduced

from, the identity of the target genes which VGAM657 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27212] LanC Lantibiotic Synthetase Component C-like 1 (bacterial) (LANCL1, Accession NM\_006055) is a VGAM657 host target gene. LANCL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LANCL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LANCL1 BINDING SITE, designated SEQ ID:12694, to the nucleotide sequence of VGAM657 RNA, herein designated VGAM RNA, also designated SEQ ID:3368.

[27213] A function of VGAM657 is therefore inhibition of LanC Lantibiotic Synthetase Component C-like 1 (bacterial) (LANCL1, Accession NM\_006055), a gene which binds the C-terminus of stomatin. Accordingly, utilities of VGAM657 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LANCL1. The function of LANCL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM656.Family with Sequence Similarity 8, Member A1 (FAM8A1, Accession NM\_016255) is another VGAM657 host target gene. FAM8A1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FAM8A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FAM8A1 BINDING SITE, designated SEQ ID:18381, to the nucleotide sequence of VGAM657 RNA, herein designated VGAM RNA, also designated SEQ ID:3368.

[27214] Another function of VGAM657 is therefore inhibition of Family with Sequence Similarity 8, Member A1 (FAM8A1, Accession NM\_016255). Accordingly, utilities of VGAM657 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FAM8A1. Origin Recognition Complex, Subunit 6 Homolog-like (yeast) (ORC6L, Accession NM\_014321) is another VGAM657 host target gene. ORC6L BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ORC6L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of ORC6L BINDING SITE, designated SEQ ID:15620, to the nucleotide sequence of VGAM657 RNA, herein designated VGAM RNA, also designated SEQ ID:3368.

[27215] Another function of VGAM657 is therefore inhibition of Origin Recognition Complex, Subunit 6 Homolog-like (yeast) (ORC6L, Accession NM\_014321). Accordingly, utilities of VGAM657 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ORC6L. Serine/threonine Kinase 38 Like (STK38L, Accession XM\_044823) is another VGAM657 host target gene. STK38L BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STK38L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STK38L BINDING SITE, designated SEQ ID:34291, to the nucleotide sequence of VGAM657 RNA, herein designated VGAM RNA, also designated SEQ ID:3368.

[27216] Another function of VGAM657 is therefore inhibition of Serine/threonine Kinase 38 Like (STK38L, Accession XM\_044823). Accordingly, utilities of VGAM657 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with STK38L. ZER6 (Accession XM\_032742) is another VGAM657 host target gene. ZER6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZER6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZER6 BINDING SITE, designated SEQ ID:31741, to the nucleotide sequence of VGAM657 RNA, herein designated VGAM RNA, also designated SEQ ID:3368.

[27217] Another function of VGAM657 is therefore inhibition of ZER6 (Accession XM\_032742). Accordingly, utilities of VGAM657 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZER6. Zinc Finger RNA Binding Protein (ZFR, Accession NM\_016107) is another VGAM657 host target gene. ZFR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZFR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZFR BINDING SITE, designated SEQ ID:18187, to the nucleotide se-

quence of VGAM657 RNA, herein designated VGAM RNA, also designated SEQ ID:3368.

[27218] Another function of VGAM657 is therefore inhibition of Zinc Finger RNA Binding Protein (ZFR, Accession NM\_016107). Accordingly, utilities of VGAM657 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFR. LOC152765 (Accession XM\_087519) is another VGAM657 host target gene. LOC152765 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152765, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152765 BINDING SITE, designated SEQ ID:39317, to the nucleotide sequence of VGAM657 RNA, herein designated VGAM RNA, also designated SEQ ID:3368.

[27219] Another function of VGAM657 is therefore inhibition of LOC152765 (Accession XM\_087519). Accordingly, utilities of VGAM657 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152765. LOC256401 (Accession XM\_171149) is another VGAM657 host target gene. LOC256401 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256401, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256401 BINDING SITE, designated SEQ ID:45946, to the nucleotide sequence of VGAM657 RNA, herein designated VGAM RNA, also designated SEQ ID:3368.

[27220] Another function of VGAM657 is therefore inhibition of LOC256401 (Accession XM\_171149). Accordingly, utilities of VGAM657 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256401. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 658 (VGAM658) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27221] VGAM658 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM658 was detected is described hereinabove with reference to Figs. 1-8.

[27222] VGAM658 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid Herpesvirus 1. VGAM658 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27223] VGAM658 gene encodes a VGAM658 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM658 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM658 precursor RNA is designated SEQ ID:644, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:644 is located at position 79923 relative to the genome of Meleagrid Herpesvirus 1.

[27224] VGAM658 precursor RNA folds onto itself, forming VGAM658 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nu-

cleotide sequence of the second half thereof.

[27225] An enzyme complex designated DICER COMPLEX, `dices` the VGAM658 folded precursor RNA into VGAM658 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM658 RNA is designated SEQ ID:3369, and is provided hereinbelow with reference to the sequence listing part.

[27226] VGAM658 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM658 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM658 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[27227] VGAM658 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM658 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM658 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM658 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM658 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[27228] The complementary binding of VGAM658 RNA, herein designated VGAM RNA, to host target binding sites on VGAM658 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM658 host target RNA into VGAM658 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27229] It is appreciated that VGAM658 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM658 host target genes. The mRNA of each one of this plurality of VGAM658 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM658 RNA, herein designated VGAM RNA, and which when bound by VGAM658 RNA causes inhibition of translation of respective one or more VGAM658 host target proteins.

[27230] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM658 gene, herein designated VGAM GENE, on one or more VGAM658 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[27231] It is yet further appreciated that a function of VGAM658 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM658 include diagnosis, prevention and treatment of viral infection by Meleagrid Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM658 correlate with, and may be deduced from, the identity of the host target genes which VGAM658 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27232] Nucleotide sequences of the VGAM658 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM658 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM658 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM658 are further described hereinbelow with reference to Table 1.

[27233] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM658 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM658 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27234] As mentioned hereinabove with reference to Fig. 1, a function of VGAM658 gene, herein designated VGAM is inhibition of expression of VGAM658 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM658 correlate with, and may be deduced from, the identity of the target genes which VGAM658 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27235] CMG2 (Accession NM\_058172) is a VGAM658 host target gene. CMG2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CMG2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of CMG2 BINDING SITE, designated SEQ ID:27716, to the nucleotide sequence of VGAM658 RNA, herein designated VGAM RNA, also designated SEQ ID:3369.

[27236] A function of VGAM658 is therefore inhibition of CMG2 (Accession NM\_058172). Accordingly, utilities of VGAM658 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CMG2. LOC91664 (Accession XM\_039908) is another VGAM658 host target gene. LOC91664 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91664, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91664 BINDING SITE, designated SEQ ID:33214, to the nucleotide sequence of VGAM658 RNA, herein designated VGAM RNA, also designated SEQ ID:3369.

[27237] Another function of VGAM658 is therefore inhibition of LOC91664 (Accession XM\_039908). Accordingly, utilities of VGAM658 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91664. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 659 (VGAM659) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27238] VGAM659 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM659 was detected is described hereinabove with reference to Figs. 1–8.

[27239] VGAM659 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid Herpesvirus 1. VGAM659 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27240] VGAM659 gene encodes a VGAM659 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM659 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM659 precursor RNA is designated SEQ ID:645, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:645 is

located at position 80037 relative to the genome of Meleagrid Herpesvirus 1.

[27241] VGAM659 precursor RNA folds onto itself, forming VGAM659 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27242] An enzyme complex designated DICER COMPLEX, `dices` the VGAM659 folded precursor RNA into VGAM659 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 57%) nucleotide sequence of VGAM659 RNA is designated SEQ ID:3370, and is provided hereinbelow with reference to the sequence listing part.

[27243] VGAM659 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM659 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM659 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[27244] VGAM659 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM659 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM659 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM659 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM659 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[27245] The complementary binding of VGAM659 RNA, herein designated VGAM RNA, to host target binding sites on VGAM659 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM659 host target RNA into VGAM659 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27246] It is appreciated that VGAM659 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM659 host target genes. The mRNA of each one of this plurality of VGAM659 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM659 RNA, herein designated VGAM RNA, and which when bound by VGAM659 RNA causes inhibition of translation of respective one or more VGAM659

host target proteins.

[27247] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM659 gene, herein designated VGAM GENE, on one or more VGAM659 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[27248] It is yet further appreciated that a function of VGAM659 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM659 include diagnosis, prevention and treatment of viral infection by Meleagrid Herpesvirus 1.

Specific functions, and accordingly utilities, of VGAM659 correlate with, and may be deduced from, the identity of the host target genes which VGAM659 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27249] Nucleotide sequences of the VGAM659 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM659 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM659 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM659 are further described hereinbelow with reference to Table 1.

[27250] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM659 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM659 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27251] As mentioned hereinabove with reference to Fig. 1, a function of VGAM659 gene, herein designated VGAM is inhibition of expression of VGAM659 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM659 correlate with, and may be deduced from, the identity of the target genes which VGAM659 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27252] ATPase, Na<sup>+</sup>/K<sup>+</sup> Transporting, Beta 2 Polypeptide (ATP1B2, Accession NM\_001678) is a VGAM659 host target gene. ATP1B2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP1B2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP1B2 BINDING SITE, designated SEQ ID:7389, to the nucleotide sequence of VGAM659 RNA, herein designated VGAM RNA, also designated SEQ ID:3370.

[27253] A function of VGAM659 is therefore inhibition of ATPase, Na<sup>+</sup>/K<sup>+</sup> Transporting, Beta 2 Polypeptide (ATP1B2, Accession NM\_001678), a gene which catalyzes the hydrolysis of ATP coupled with the exchange of Na<sup>+</sup>/K<sup>+</sup> ions across the plasma membrane. Accordingly, utilities of VGAM659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP1B2. The function of ATP1B2 and its association with various

diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM152.Disabled Homolog 2, Mitogen-responsive Phosphoprotein (Drosophila) (DAB2, Accession NM\_001343) is another VGAM659 host target gene. DAB2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DAB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAB2 BINDING SITE, designated SEQ ID:7021, to the nucleotide sequence of VGAM659 RNA, herein designated VGAM RNA, also designated SEQ ID:3370.

[27254] Another function of VGAM659 is therefore inhibition of Disabled Homolog 2, Mitogen-responsive Phosphoprotein (Drosophila) (DAB2, Accession NM\_001343), a gene which may be a component of the csf-1 signal transduction pathway. Accordingly, utilities of VGAM659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAB2. The function of DAB2 has been established by previous studies. Mok et al. (1994) used a PCR-based differential display method to identify genes expressed in ovarian cancer. Two cDNAs,

termed DOC1 and DOC2 by them (for Differentially expressed in Ovarian Cancer), were identified that were expressed in normal ovarian epithelial cells but were down-regulated or absent from ovarian carcinoma cell lines. Albertsen et al. (1996) determined the complete sequence of the 3.2-kb DOC2 cDNA. They also cloned a genomic fragment at the 5-prime end of the gene which includes exons 1 to 8. The 770-amino acid predicted protein has an overall 83% identity with the mouse p96 protein, a putative mitogen-responsive phosphoprotein; homology is strongest in the amino-terminal end of the protein in a region corresponding to the phosphotyrosine interaction domain. The mouse p96 protein is phosphorylated on serine residues rather than tyrosines; phosphorylation is lowest in the G1 cell cycle stage but rapidly increases following mitogenic stimulation with colony stimulating factor (OMIM Ref. No. 120420)(Xu et al., 1995). Albertsen et al. (1996) mapped the DOC2 gene to 5p13 by fluorescence in situ hybridization and confirmed the mapping through analysis of a human/rodent somatic cell hybrid mapping panel. The authors stated that DOC2 is expressed in at least 7 different human tissues and that it and its murine homolog are likely expressed in a tissue-

independent manner. Mok et al. (1998) reported that when DOC2 was transfected into an ovarian carcinoma cell line, the stable transfectants showed significantly reduced growth rate and ability to form tumors in nude mice.

[27255] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[27256] Mok, S. C.; Chan, W. Y.; Wong, K. K.; Cheung, K. K.; Lau, C. C.; Ng, S. W.; Baldini, A.; Colitti, C. V.; Rock, C. O.; Berkowitz, R. S. : DOC-2, a candidate tumor suppressor gene in human epithelial ovarian cancer. *Oncogene* 16: 2381-2387, 1998. ; and

[27257] Xu, X.-X.; Yang, W.; Jackowski, S.; Rock, C. O. : Cloning of a novel phosphoprotein regulated by colony-stimulating factor 1 shares a domain with the *Drosophila* disabled gene product. *J.*

[27258] Further studies establishing the function and utilities of DAB2 are found in John Hopkins OMIM database record ID 601236, and in cited publications numbered 2837-283 and 2827-2828 listed in the bibliography section herein-below, which are also hereby incorporated by reference. Potassium Voltage-gated Channel, Shaker-related Subfamily, Beta Member 2 (KCNA2, Accession

NM\_003636) is another VGAM659 host target gene. KCNAB2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KCNAB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNAB2 BINDING SITE, designated SEQ ID:9704, to the nucleotide sequence of VGAM659 RNA, herein designated VGAM RNA, also designated SEQ ID:3370.

[27259] Another function of VGAM659 is therefore inhibition of Potassium Voltage-gated Channel, Shaker-related Subfamily, Beta Member 2 (KCNAB2, Accession NM\_003636), a gene which is the beta subunit of shaker voltage-gated potassium channels. Accordingly, utilities of VGAM659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNAB2. The function of KCNAB2 has been established by previous studies. 'Shaker' and other voltage-dependent potassium channel proteins help to determine the electrical properties of excitable cells and play additional physiologic roles in nonexcitable cell types. See KCNA1 (OMIM Ref. No. 176260). Mammalian Shaker potassium channel alpha

subunits associate with cytoplasmic beta subunits that modulate the inactivation of the channel. The beta subunits belong to a superfamily of NAD(P)H-dependent enzymes, suggesting that they may be involved in additional physiologic processes. Shaker potassium channel complexes are thought to be composed of 4 alpha and 4 beta subunits. By PCR of a human hippocampal library with degenerate primers based on conserved regions of rat beta-1 (KCNA1B; 601141) and beta-2 subunits, McCormack et al. (1995) isolated cDNAs encoding human beta-1 and beta-2. The predicted 367-amino acid human, bovine, and rat beta-2 subunits are 99% identical. Unlike beta-1, the beta-2 subunit does not contain an N-terminal inactivation 'ball' domain. Instead, functional studies of beta-2 expressed in *Xenopus* oocytes indicated that it increased the rate of the endogenous Kv1.4 alpha subunit (OMIM Ref. No. 176266) inactivation process. Leicher et al. (1998) reported that the KCNA2B gene contains 15 exons and spans approximately 70 kb. The exon/intron structure of KCNA2B is comparable to that of KCNA1B and KCNA3B (OMIM Ref. No. 604111), although the size of the introns varies significantly among the genes. By analysis of somatic cell hybrids and by FISH, Schultz et al. (1996)

mapped the KCNA2B gene to 1p36.3. The results of Gong et al. (1999) suggested that ZIP, the rat homolog of p62 (OMIM Ref. No. 601530), acts as a link that targets the activity of Kv-beta-2 and PKC-zeta

[27260] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[27261] Gong, J.; Xu, J.; Bezanilla, M.; van Huizen, R.; Derin, R.; Li, M. : Differential stimulation of PKC phosphorylation of potassium channels by ZIP1 and ZIP2. Science 285: 1565–1569, 1999. ; and

[27262] Leicher, T.; Bähring, R.; Isbrandt, D.; Pongs, O. : Coexpression of the KCNA3B gene product with Kv1.5 leads to a novel A-type potassium channel. J. Biol. Chem. 273: 35095–35101, 1998.

[27263] Further studies establishing the function and utilities of KCNA2B are found in John Hopkins OMIM database record ID 601142, and in cited publications numbered 1548, 284 and 2848–2849 listed in the bibliography section herein–below, which are also hereby incorporated by reference. Metastasis-associated 1-like 1 (MTA1L1, Accession NM\_004739) is another VGAM659 host target gene. MTA1L1 BINDING SITE is HOST TARGET binding site found

in the 3' untranslated region of mRNA encoded by MTA1L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MTA1L1 BINDING SITE, designated SEQ ID:11137, to the nucleotide sequence of VGAM659 RNA, herein designated VGAM RNA, also designated SEQ ID:3370.

[27264] Another function of VGAM659 is therefore inhibition of Metastasis-associated 1-like 1 (MTA1L1, Accession NM\_004739), a gene which regulates histone deacetylase core complex enzymatic activity. Accordingly, utilities of VGAM659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTA1L1. The function of MTA1L1 has been established by previous studies. The p53 tumor suppressor (OMIM Ref. No. 191170) is a transcriptional factor whose activity is modulated by protein stability and posttranslational modifications including acetylation. Luo et al. (2000) showed that deacetylation of p53 is mediated by a histone deacetylase-1 (HDAC1; 601241)-containing complex. They also purified a p53 target protein, which they named PID, in the deacetylase complexes. PID is identical to MTA1L1,

also called MTA2, which had been identified as a component of the nucleosome remodeling and histone deacetylation (NURD) complex. The authors found that MTA1L1 specifically interacts with p53 both in vitro and in vivo, and its expression reduces significantly the steady-state levels of acetylated p53. MTA1L1 expression strongly represses p53-dependent transcriptional activation, and, notably, it modulates p53-mediated cell growth arrest and apoptosis. Luo et al. (2000) concluded that their results show that deacetylation and functional interactions between the MTA1L1-associated NURD complex may represent an important pathway to regulate p53 function. Zhang et al. (1999) showed that MTA2 and the 32-kD MBD3 (OMIM Ref. No. 603573) protein are subunits of the NURD complex. Immunoprecipitation analysis showed that MBD3 interacts with HDAC1, RBBP4 (OMIM Ref. No. 602923), and RBBP7 (OMIM Ref. No. 602922), but not with MI2 (CHD4; 603277), suggesting that MBD3 is embedded within the NURD complex. The authors found that MTA2 directs the assembly of an active histone deacetylase complex and that the association of MTA2 with the complex requires MBD3. Gel mobility shift analysis determined that both NURD and MBD3 are unable to bind to methy-

lated DNA in the absence of MBD2 (OMIM Ref. No. 603547). Zhang et al. (1999) proposed that NURD is involved in the transcriptional repression of methylated DNA. Wade et al. (1999) also identified MTA1, MTA1L, and MBD3 as components of the NURD complex, which they referred to as the MI2 complex.

[27265] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[27266] Futamura, M.; Nishimori, H.; Shiratsuchi, T.; Saji, S.; Nakamura, Y.; Tokino, T. : Molecular cloning, mapping, and characterization of a novel human gene, MTA1-L1, showing homology to a metastasis-associated gene, MTA1. J. Hum. Genet. 44: 52-56, 1999. ; and

[27267] Luo, J.; Su, F.; Chen, D.; Shiloh, A.; Gu, W. : Deacetylation of p53 modulates its effect on cell growth and apoptosis. Nature 408: 377-381, 2000.

[27268] Further studies establishing the function and utilities of MTA1L1 are found in John Hopkins OMIM database record ID 603947, and in cited publications numbered 635, 752 and 5173 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Neuroligin 1 (NLGN1, Accession NM\_014932) is an-

other VGAM659 host target gene. NLGN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NLGN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NLGN1 BINDING SITE, designated SEQ ID:17230, to the nucleotide sequence of VGAM659 RNA, herein designated VGAM RNA, also designated SEQ ID:3370.

[27269] Another function of VGAM659 is therefore inhibition of Neuroligin 1 (NLGN1, Accession NM\_014932), a gene which may trigger the de novo formation of presynaptic structure. Accordingly, utilities of VGAM659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NLGN1. The function of NLGN1 has been established by previous studies. Neurexins (see OMIM Ref. No. NRXN1; 600565) are neuronal cell surface proteins first identified in rat brain with hundreds of isoforms generated by alternative splicing. Ichtchenko et al. (1995) described neuroligin I, a neuronal cell surface protein that is enriched in rat synaptic plasma membranes and acts as a splice site-specific ligand for beta-neurexins. (Each of 3 genes encoding neurexins--NRXN1,

NRXN2, and NRXN3--has 2 independent promoters and generates 2 classes of mRNAs. The longer mRNAs encode alpha-neurexins and the shorter mRNAs beta-neurexins.) Neuroligin I binds to beta-neurexins only if they lack an insert in the alternatively spliced sequence of the G domain, and not if they contain an insert. The extracellular sequence of rat neuroligin I is composed of a catalytically inactive esterase domain homologous to acetylcholinesterase. Ichtchenko et al. (1995) used in situ hybridization to demonstrate that alternative splicing of neurexins at the binding site recognized by neuroligin I is highly regulated. These findings support a model whereby alternative splicing of neurexins creates a family of cell surface receptors that confer interactive specificity on their resident neurons. Using an in vitro system, Scheiffele et al. (2000) demonstrated that mouse neuroligin-1 and -2, postsynaptically localized proteins, can trigger the de novo formation of presynaptic structure. Nonneuronal cells engineered to express neuroligins induced morphologic and functional presynaptic differentiation in contacting axons. This activity could be inhibited by addition of a soluble version of beta-neurexin. Furthermore, addition of soluble beta-neurexin to a coculture of defined pre- and

postsynaptic central nervous system (CNS) neurons inhibited synaptic vesicle clustering in axons contacting target neurons. These results suggested that neuroligins are part of the machinery employed during the formation and remodeling of CNS synapses.

[27270] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[27271] Ichtchenko, K.; Hata, Y.; Nguyen, T.; Ullrich, B.; Missler, M.; Moomaw, C.; Sudhof, T. C. : Neuroligin 1: a splice site-specific ligand for beta-neurexins. *Cell* 81: 435-443, 1995. ; and

[27272] Scheiffele, P.; Fan, J.; Cho, J.; Fetter, R.; Serafini, T. : Neuroligin expressed in nonneuronal cells triggers presynaptic development in contacting axons. *Cell* 101: 657-669, 2000.

[27273] Further studies establishing the function and utilities of NLGN1 are found in John Hopkins OMIM database record ID 600568, and in cited publications numbered 8170, 836 and 9531 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. O-linked N-acetylglucosamine (GlcNAc) Transferase (UDP-N-acetylglucosamine:polypeptide-N-acetylglucosam

inyl transferase) (OGT, Accession NM\_003605) is another VGAM659 host target gene. OGT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OGT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OGT BINDING SITE, designated SEQ ID:9660, to the nucleotide sequence of VGAM659 RNA, herein designated VGAM RNA, also designated SEQ ID:3370.

[27274] Another function of VGAM659 is therefore inhibition of O-linked N-acetylglucosamine (GlcNAc) Transferase (UDP-N-acetylglucosamine:polypeptide-N-acetylglucosaminyl transferase) (OGT, Accession NM\_003605), a gene which has a role in the glycosylation of nuclear and cytoplasmic proteins. Accordingly, utilities of VGAM659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OGT. The function of OGT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM464. Transient Receptor Potential Cation Channel, Subfamily M, Member 6 (TRPM6, Accession NM\_017662) is

another VGAM659 host target gene. TRPM6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TRPM6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPM6 BINDING SITE, designated SEQ ID:19203, to the nucleotide sequence of VGAM659 RNA, herein designated VGAM RNA, also designated SEQ ID:3370.

[27275] Another function of VGAM659 is therefore inhibition of Transient Receptor Potential Cation Channel, Subfamily M, Member 6 (TRPM6, Accession NM\_017662), a gene which contains a predicted ion channel domain and a protein kinase domain. Accordingly, utilities of VGAM659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPM6. The function of TRPM6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM173. Von Hippel-Lindau Syndrome (VHL, Accession NM\_000551) is another VGAM659 host target gene. VHL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by VHL, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VHL BINDING SITE, designated SEQ ID:6162, to the nucleotide sequence of VGAM659 RNA, herein designated VGAM RNA, also designated SEQ ID:3370.

[27276] Another function of VGAM659 is therefore inhibition of Von Hippel–Lindau Syndrome (VHL, Accession NM\_000551), a gene which may control rna stability through the selective degradation of rna-bound proteins. Accordingly, utilities of VGAM659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VHL. The function of VHL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM197.DKFZp434H2226 (Accession XM\_043863) is another VGAM659 host target gene. DKFZp434H2226 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZp434H2226, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434H2226

BINDING SITE, designated SEQ ID:34034, to the nucleotide sequence of VGAM659 RNA, herein designated VGAM RNA, also designated SEQ ID:3370.

[27277] Another function of VGAM659 is therefore inhibition of DKFZp434H2226 (Accession XM\_043863). Accordingly, utilities of VGAM659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434H2226. FLJ20758 (Accession NM\_017952) is another VGAM659 host target gene. FLJ20758 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ20758, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20758 BINDING SITE, designated SEQ ID:19654, to the nucleotide sequence of VGAM659 RNA, herein designated VGAM RNA, also designated SEQ ID:3370.

[27278] Another function of VGAM659 is therefore inhibition of FLJ20758 (Accession NM\_017952). Accordingly, utilities of VGAM659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20758. KIAA0215 (Accession NM\_014735) is another VGAM659 host target gene. KIAA0215 BINDING SITE is HOST TARGET

binding site found in the 5` untranslated region of mRNA encoded by KIAA0215, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0215 BINDING SITE, designated SEQ ID:16384, to the nucleotide sequence of VGAM659 RNA, herein designated VGAM RNA, also designated SEQ ID:3370.

[27279] Another function of VGAM659 is therefore inhibition of KIAA0215 (Accession NM\_014735). Accordingly, utilities of VGAM659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0215. LOC152317 (Accession XM\_098189) is another VGAM659 host target gene. LOC152317 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC152317, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152317 BINDING SITE, designated SEQ ID:41465, to the nucleotide sequence of VGAM659 RNA, herein designated VGAM RNA, also designated SEQ ID:3370.

[27280] Another function of VGAM659 is therefore inhibition of

LOC152317 (Accession XM\_098189). Accordingly, utilities of VGAM659 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152317. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 660 (VGAM660) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27281] VGAM660 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM660 was detected is described hereinabove with reference to Figs. 1–8.

[27282] VGAM660 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid Herpesvirus 1. VGAM660 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27283] VGAM660 gene encodes a VGAM660 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM660 precursor RNA does not encode a protein. A nucleotide

sequence identical or highly similar to the nucleotide sequence of VGAM660 precursor RNA is designated SEQ ID:646, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:646 is located at position 80746 relative to the genome of Meleagrid Herpesvirus 1.

[27284] VGAM660 precursor RNA folds onto itself, forming VGAM660 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27285] An enzyme complex designated DICER COMPLEX, `dices` the VGAM660 folded precursor RNA into VGAM660 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide se-

quence of VGAM660 RNA is designated SEQ ID:3371, and is provided hereinbelow with reference to the sequence listing part.

[27286] VGAM660 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM660 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM660 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[27287] VGAM660 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM660 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM660 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM660 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM660 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[27288] The complementary binding of VGAM660 RNA, herein designated VGAM RNA, to host target binding sites on VGAM660 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM660 host target RNA into VGAM660 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27289] It is appreciated that VGAM660 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM660 host target genes. The mRNA of each one of this plurality of VGAM660 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM660 RNA, herein designated VGAM RNA, and which when bound by VGAM660 RNA causes inhibition of translation of respective one or more VGAM660 host target proteins.

[27290] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM660 gene, herein designated VGAM GENE, on one or more VGAM660 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[27291] It is yet further appreciated that a function of VGAM660 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM660 include diagnosis, prevention and treatment of viral infection by Meleagrid Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM660 correlate with, and may be deduced from, the identity of the host target genes which VGAM660 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27292] Nucleotide sequences of the VGAM660 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM660 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM660 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM660 are further described hereinbelow with reference to Table 1.

[27293] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM660 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM660 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27294] As mentioned hereinabove with reference to Fig. 1, a function of VGAM660 gene, herein designated VGAM is inhibition of expression of VGAM660 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM660 correlate with, and may be deduced from, the identity of the target genes which VGAM660 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27295] LOC92106 (Accession NM\_138381) is a VGAM660 host target gene. LOC92106 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92106, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92106 BINDING SITE, designated SEQ ID:28755, to the nucleotide sequence of VGAM660 RNA, herein designated VGAM RNA, also designated SEQ ID:3371.

[27296] A function of VGAM660 is therefore inhibition of LOC92106 (Accession NM\_138381). Accordingly, utilities of VGAM660 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92106. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 661 (VGAM661) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27297] VGAM661 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM661 was detected is described hereinabove with reference to Figs. 1–8.

[27298] VGAM661 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Heliothis Zea Virus 1 (HZV–1). VGAM661 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27299] VGAM661 gene encodes a VGAM661 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM661 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM661 precursor RNA is designated SEQ ID:647, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:647 is

located at position 4270 relative to the genome of Heliothis Zea Virus 1 (HZV-1).

[27300] VGAM661 precursor RNA folds onto itself, forming VGAM661 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27301] An enzyme complex designated DICER COMPLEX, `dices` the VGAM661 folded precursor RNA into VGAM661 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of VGAM661 RNA is designated SEQ ID:3372, and is provided hereinbelow with reference to the sequence listing part.

[27302] VGAM661 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM661 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM661 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[27303] VGAM661 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM661 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM661 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM661 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM661 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[27304] The complementary binding of VGAM661 RNA, herein designated VGAM RNA, to host target binding sites on VGAM661 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM661 host target RNA into VGAM661 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27305] It is appreciated that VGAM661 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM661 host target genes. The mRNA of each one of this plurality of VGAM661 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM661 RNA, herein designated VGAM RNA, and which when bound by VGAM661 RNA causes inhibition of translation of respective one or more VGAM661

host target proteins.

[27306] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM661 gene, herein designated VGAM GENE, on one or more VGAM661 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[27307] It is yet further appreciated that a function of VGAM661 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM661 include diagnosis, prevention and treatment of viral infection by Heliothis Zea Virus 1

(HZV-1). Specific functions, and accordingly utilities, of VGAM661 correlate with, and may be deduced from, the identity of the host target genes which VGAM661 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27308] Nucleotide sequences of the VGAM661 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM661 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM661 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM661 are further described hereinbelow with reference to Table 1.

[27309] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM661 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM661 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27310] As mentioned hereinabove with reference to Fig. 1, a function of VGAM661 gene, herein designated VGAM is inhibition of expression of VGAM661 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM661 correlate with, and may be deduced from, the identity of the target genes which VGAM661 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27311] TSG (Accession NM\_020648) is a VGAM661 host target gene. TSG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TSG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TSG BINDING SITE, designated SEQ ID:21810, to the nucleotide sequence of VGAM661 RNA, herein designated VGAM RNA, also designated SEQ ID:3372.

[27312] A function of VGAM661 is therefore inhibition of TSG (Accession NM\_020648). Accordingly, utilities of VGAM661 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TSG. Zinc Finger Protein 214 (ZNF214, Accession NM\_013249) is another VGAM661 host target gene. ZNF214 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ZNF214, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of ZNF214 BINDING SITE, designated SEQ ID:14910, to the nucleotide sequence of VGAM661 RNA, herein designated VGAM RNA, also designated SEQ ID:3372.

[27313] Another function of VGAM661 is therefore inhibition of Zinc Finger Protein 214 (ZNF214, Accession NM\_013249). Accordingly, utilities of VGAM661 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF214. ALDH9 (Accession NM\_000696) is another VGAM661 host target gene. ALDH9 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ALDH9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALDH9 BINDING SITE, designated SEQ ID:6359, to the nucleotide sequence of VGAM661 RNA, herein designated VGAM RNA, also designated SEQ ID:3372.

[27314] Another function of VGAM661 is therefore inhibition of ALDH9 (Accession NM\_000696). Accordingly, utilities of VGAM661 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALDH9. LIM and SH3 Protein 1 (LASP1, Accession NM\_006148) is

another VGAM661 host target gene. LASP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LASP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LASP1 BINDING SITE, designated SEQ ID:12790, to the nucleotide sequence of VGAM661 RNA, herein designated VGAM RNA, also designated SEQ ID:3372.

[27315] Another function of VGAM661 is therefore inhibition of LIM and SH3 Protein 1 (LASP1, Accession NM\_006148). Accordingly, utilities of VGAM661 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LASP1. LOC121504 (Accession XM\_058571) is another VGAM661 host target gene. LOC121504 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC121504, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC121504 BINDING SITE, designated SEQ ID:36669, to the nucleotide sequence of VGAM661 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:3372.

[27316] Another function of VGAM661 is therefore inhibition of LOC121504 (Accession XM\_058571). Accordingly, utilities of VGAM661 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC121504. LOC153937 (Accession XM\_087813) is another VGAM661 host target gene. LOC153937 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC153937, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153937 BINDING SITE, designated SEQ ID:39444, to the nucleotide sequence of VGAM661 RNA, herein designated VGAM RNA, also designated SEQ ID:3372.

[27317] Another function of VGAM661 is therefore inhibition of LOC153937 (Accession XM\_087813). Accordingly, utilities of VGAM661 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153937. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 662 (VGAM662) viral gene, which modu-

lates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27318] VGAM662 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM662 was detected is described hereinabove with reference to Figs. 1–8.

[27319] VGAM662 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM662 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27320] VGAM662 gene encodes a VGAM662 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM662 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM662 precursor RNA is designated SEQ ID:648, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:648 is located at position 123220 relative to the genome of Vaccinia Virus.

[27321] VGAM662 precursor RNA folds onto itself, forming

VGAM662 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27322] An enzyme complex designated DICER COMPLEX, `dices` the VGAM662 folded precursor RNA into VGAM662 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM662 RNA is designated SEQ ID:3373, and is provided hereinbelow with reference to the sequence listing part.

[27323] VGAM662 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM662 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM662 host target RNA comprises

three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[27324] VGAM662 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM662 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM662 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM662 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM662 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[27325] The complementary binding of VGAM662 RNA, herein designated VGAM RNA, to host target binding sites on VGAM662 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM662 host target RNA into VGAM662 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27326] It is appreciated that VGAM662 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM662 host target genes. The mRNA of each one of this plurality of VGAM662 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM662 RNA, herein designated VGAM RNA, and which when bound by VGAM662 RNA causes inhibition of translation of respective one or more VGAM662 host target proteins.

[27327] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM662 gene, herein designated VGAM GENE, on one or more VGAM662 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[27328] It is yet further appreciated that a function of VGAM662 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM662 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM662 correlate with, and may be deduced from, the identity of the host target genes which VGAM662 binds and inhibits, and the

function of these host target genes, as elaborated herein–below.

[27329] Nucleotide sequences of the VGAM662 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM662 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM662 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM662 are further described hereinbelow with reference to Table 1.

[27330] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM662 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM662 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27331] As mentioned hereinabove with reference to Fig. 1, a function of VGAM662 gene, herein designated VGAM is inhibition of expression of VGAM662 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM662 correlate with, and may be deduced from, the identity of the target genes which VGAM662 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[27332] Calcitonin Receptor (CALCR, Accession NM\_001742) is a VGAM662 host target gene. CALCR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CALCR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CALCR BINDING SITE, designated SEQ ID:7479, to the nucleotide sequence of VGAM662 RNA, herein designated VGAM RNA, also designated SEQ ID:3373.

[27333] A function of VGAM662 is therefore inhibition of Calcitonin Receptor (CALCR, Accession NM\_001742), a gene which is a receptor for calcitonin, is mediated by g proteins which activate adenylyl cyclase, and thought to couple to the heterotrimeric guanosine triphosphate-binding protein that is sensitive to cholera toxin. Accordingly, utilities of VGAM662 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CALCR. The function of CALCR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM94.Lymphotoxin Alpha (TNF superfam-

ily, member 1) (LTA, Accession NM\_000595) is another VGAM662 host target gene. LTA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LTA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LTA BINDING SITE, designated SEQ ID:6194, to the nucleotide sequence of VGAM662 RNA, herein designated VGAM RNA, also designated SEQ ID:3373.

[27334] Another function of VGAM662 is therefore inhibition of Lymphotoxin Alpha (TNF superfamily, member 1) (LTA, Accession NM\_000595), a gene which is a cytokine that in its homotrimeric form binds to tnfrsf1a/tnfr1, tnfrsf1b/tnfr and tnfrsf14/hvem. Accordingly, utilities of VGAM662 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LTA. The function of LTA has been established by previous studies. Lymphotoxin was first characterized as a biologic factor in mitogen-stimulated lymphocytes having anticellular activity on neoplastic cell lines. It is a glycoprotein with a relative molecular mass (Mr) of 60,000–70,000, whereas monomeric lymphotoxin has an Mr of 25,000. Gray et al.

(1984) isolated a chemically synthesized gene and natural complementary DNA coding for human lymphotoxin and engineered them for expression in *E. coli*. Cytotoxic and necrosis effects were observed in murine and human tumor cell lines in vitro and in murine sarcomas in vivo.

TNF-beta (also known as lymphotoxin-alpha, or LTA) shows 35% identity and 50% homology in amino acid sequence with the TNF-alpha (OMIM Ref. No. 191160). Aggarwal et al. (1985) showed that the 2 TNFs share a common receptor on tumor cells See 191160 for information on the situation of both TNFA and TNFB on 6p. By analysis of deletions induced in lymphoblastoid cells by gamma-irradiation, Evans et al. (1989) concluded that TNFB maps to the interval between C4 and HLA-B. Spies et al. (1989) showed that the TNF-alpha and TNF-beta gene cluster is about 210 kb from HLA-B on 6p21.3. Jongeneel et al. (1991) described polymorphic microsatellites within a 12-kb region of the major histocompatibility complex that includes the TNFB locus. Lymphotoxin-alpha in a homotrimeric form is a soluble protein secreted by activated lymphocytes and presumed to act as a modulator in the immune response. The LT-alpha homotrimer shares its receptor with tumor necrosis factor and binds to both TNF

receptor-1 (OMIM Ref. No. 191190) and -2 (191191

[27335] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[27336] Aggarwal, B. B.; Eessalu, T. E.; Hass, P. E. : Characterization of receptors for human tumour necrosis factor and their regulation by gamma-interferon. Nature 318: 665-667, 1985. ; and

[27337] Evans, A. M.; Petersen, J. W.; Sekhon, G. S.; DeMars, R. : Mapping of prolactin and tumor necrosis factor-beta genes on human chromosome 6p using lymphoblastoid cell deletion mutants. Somat.

[27338] Further studies establishing the function and utilities of LTA are found in John Hopkins OMIM database record ID 153440, and in cited publications numbered 663-66 and 3544 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Zinc-fingers and Homeoboxes 1 (ZHX1, Accession NM\_007222) is another VGAM662 host target gene. ZHX1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZHX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of ZHX1 BINDING SITE, designated SEQ ID:14091, to the nucleotide sequence of VGAM662 RNA, herein designated VGAM RNA, also designated SEQ ID:3373.

[27339] Another function of VGAM662 is therefore inhibition of Zinc-fingers and Homeoboxes 1 (ZHX1, Accession NM\_007222). Accordingly, utilities of VGAM662 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZHX1. DKFZP434C1715 (Accession XM\_098421) is another VGAM662 host target gene. DKFZP434C1715 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434C1715, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434C1715 BINDING SITE, designated SEQ ID:41672, to the nucleotide sequence of VGAM662 RNA, herein designated VGAM RNA, also designated SEQ ID:3373.

[27340] Another function of VGAM662 is therefore inhibition of DKFZP434C1715 (Accession XM\_098421). Accordingly, utilities of VGAM662 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with DKFZP434C1715. FLJ23556 (Accession NM\_024880) is another VGAM662 host target gene. FLJ23556 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23556, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23556 BINDING SITE, designated SEQ ID:24318, to the nucleotide sequence of VGAM662 RNA, herein designated VGAM RNA, also designated SEQ ID:3373.

[27341] Another function of VGAM662 is therefore inhibition of FLJ23556 (Accession NM\_024880). Accordingly, utilities of VGAM662 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23556. IDN3 (Accession NM\_133433) is another VGAM662 host target gene. IDN3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IDN3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IDN3 BINDING SITE, designated SEQ ID:28510, to the nucleotide sequence of VGAM662 RNA, herein designated VGAM RNA, also designated SEQ

ID:3373.

[27342] Another function of VGAM662 is therefore inhibition of IDN3 (Accession NM\_133433). Accordingly, utilities of VGAM662 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IDN3. KIAA1456 (Accession XM\_040100) is another VGAM662 host target gene. KIAA1456 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1456, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1456 BINDING SITE, designated SEQ ID:33262, to the nucleotide sequence of VGAM662 RNA, herein designated VGAM RNA, also designated SEQ ID:3373.

[27343] Another function of VGAM662 is therefore inhibition of KIAA1456 (Accession XM\_040100). Accordingly, utilities of VGAM662 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1456. Neurexophilin 3 (NXPH3, Accession XM\_037847) is another VGAM662 host target gene. NXPH3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

NXPH3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NXPH3 BINDING SITE, designated SEQ ID:32714, to the nucleotide sequence of VGAM662 RNA, herein designated VGAM RNA, also designated SEQ ID:3373.

[27344] Another function of VGAM662 is therefore inhibition of Neurexophilin 3 (NXPH3, Accession XM\_037847). Accordingly, utilities of VGAM662 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NXPH3. PNPASE (Accession XM\_048088) is another VGAM662 host target gene. PNPASE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PNPASE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PNPASE BINDING SITE, designated SEQ ID:35103, to the nucleotide sequence of VGAM662 RNA, herein designated VGAM RNA, also designated SEQ ID:3373.

[27345] Another function of VGAM662 is therefore inhibition of PNPASE (Accession XM\_048088). Accordingly, utilities of

VGAM662 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PNPASE. Zinc Finger Protein 33a (KOX 31) (ZNF33A, Accession XM\_166119) is another VGAM662 host target gene. ZNF33A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF33A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF33A BINDING SITE, designated SEQ ID:43896, to the nucleotide sequence of VGAM662 RNA, herein designated VGAM RNA, also designated SEQ ID:3373.

[27346] Another function of VGAM662 is therefore inhibition of Zinc Finger Protein 33a (KOX 31) (ZNF33A, Accession XM\_166119). Accordingly, utilities of VGAM662 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF33A. LOC126282 (Accession XM\_059012) is another VGAM662 host target gene. LOC126282 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC126282, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126282 BINDING SITE, designated SEQ ID:36816, to the nucleotide sequence of VGAM662 RNA, herein designated VGAM RNA, also designated SEQ ID:3373.

[27347] Another function of VGAM662 is therefore inhibition of LOC126282 (Accession XM\_059012). Accordingly, utilities of VGAM662 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126282. LOC144583 (Accession XM\_084907) is another VGAM662 host target gene. LOC144583 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144583, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144583 BINDING SITE, designated SEQ ID:37767, to the nucleotide sequence of VGAM662 RNA, herein designated VGAM RNA, also designated SEQ ID:3373.

[27348] Another function of VGAM662 is therefore inhibition of LOC144583 (Accession XM\_084907). Accordingly, utilities of VGAM662 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC144583. LOC145231 (Accession XM\_096740) is another VGAM662 host target gene. LOC145231 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145231, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145231 BINDING SITE, designated SEQ ID:40518, to the nucleotide sequence of VGAM662 RNA, herein designated VGAM RNA, also designated SEQ ID:3373.

[27349] Another function of VGAM662 is therefore inhibition of LOC145231 (Accession XM\_096740). Accordingly, utilities of VGAM662 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145231. LOC147837 (Accession XM\_085915) is another VGAM662 host target gene. LOC147837 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147837, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147837 BINDING SITE, designated SEQ ID:38392, to the nucleotide sequence of VGAM662 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3373.

[27350] Another function of VGAM662 is therefore inhibition of LOC147837 (Accession XM\_085915). Accordingly, utilities of VGAM662 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147837. LOC149910 (Accession XM\_086699) is another VGAM662 host target gene. LOC149910 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149910, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149910 BINDING SITE, designated SEQ ID:38827, to the nucleotide sequence of VGAM662 RNA, herein designated VGAM RNA, also designated SEQ ID:3373.

[27351] Another function of VGAM662 is therefore inhibition of LOC149910 (Accession XM\_086699). Accordingly, utilities of VGAM662 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149910. LOC158160 (Accession XM\_054490) is another VGAM662 host target gene. LOC158160 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158160, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158160 BINDING SITE, designated SEQ ID:36168, to the nucleotide sequence of VGAM662 RNA, herein designated VGAM RNA, also designated SEQ ID:3373.

[27352] Another function of VGAM662 is therefore inhibition of LOC158160 (Accession XM\_054490). Accordingly, utilities of VGAM662 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158160. LOC158292 (Accession XM\_098914) is another VGAM662 host target gene. LOC158292 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158292, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158292 BINDING SITE, designated SEQ ID:41932, to the nucleotide sequence of VGAM662 RNA, herein designated VGAM RNA, also designated SEQ ID:3373.

[27353] Another function of VGAM662 is therefore inhibition of LOC158292 (Accession XM\_098914). Accordingly, utilities of VGAM662 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC158292. LOC162333 (Accession XM\_102591) is another VGAM662 host target gene. LOC162333 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC162333, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC162333 BINDING SITE, designated SEQ ID:42129, to the nucleotide sequence of VGAM662 RNA, herein designated VGAM RNA, also designated SEQ ID:3373.

[27354] Another function of VGAM662 is therefore inhibition of LOC162333 (Accession XM\_102591). Accordingly, utilities of VGAM662 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC162333. LOC202018 (Accession XM\_114420) is another VGAM662 host target gene. LOC202018 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC202018, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202018 BINDING SITE, designated SEQ ID:42958, to

the nucleotide sequence of VGAM662 RNA, herein designated VGAM RNA, also designated SEQ ID:3373.

[27355] Another function of VGAM662 is therefore inhibition of LOC202018 (Accession XM\_114420). Accordingly, utilities of VGAM662 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202018. LOC219392 (Accession XM\_165921) is another VGAM662 host target gene. LOC219392 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC219392, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219392 BINDING SITE, designated SEQ ID:43799, to the nucleotide sequence of VGAM662 RNA, herein designated VGAM RNA, also designated SEQ ID:3373.

[27356] Another function of VGAM662 is therefore inhibition of LOC219392 (Accession XM\_165921). Accordingly, utilities of VGAM662 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219392. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 663 (VGAM663) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27357] VGAM663 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM663 was detected is described hereinabove with reference to Figs. 1–8.

[27358] VGAM663 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rachiplusia Ou Multiple Nucleopolyhedrovirus. VGAM663 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27359] VGAM663 gene encodes a VGAM663 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM663 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM663 precursor RNA is designated SEQ ID:649, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:649 is located at position 325 relative to the genome of Rachiplusia Ou Multiple Nucleopolyhedrovirus.

[27360] VGAM663 precursor RNA folds onto itself, forming VGAM663 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27361] An enzyme complex designated DICER COMPLEX, `dices` the VGAM663 folded precursor RNA into VGAM663 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM663 RNA is designated SEQ ID:3374, and is provided hereinbelow with reference to the sequence listing part.

[27362] VGAM663 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM663 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM663 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[27363] VGAM663 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM663 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM663 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM663 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM663 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[27364] The complementary binding of VGAM663 RNA, herein designated VGAM RNA, to host target binding sites on VGAM663 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM663 host target RNA into VGAM663 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27365] It is appreciated that VGAM663 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM663 host target genes. The mRNA of each one of this plurality of VGAM663 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM663 RNA, herein designated VGAM RNA, and which when bound by VGAM663 RNA causes inhibition of translation of respective one or more VGAM663 host target proteins.

[27366] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM663 gene, herein designated VGAM GENE, on one or more VGAM663 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[27367] It is yet further appreciated that a function of VGAM663 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM663 include diagnosis, prevention and treatment of viral infection by Rachiplusia Ou Multiple Nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM663 correlate with, and may be deduced

from, the identity of the host target genes which VGAM663 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27368] Nucleotide sequences of the VGAM663 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM663 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM663 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM663 are further described hereinbelow with reference to Table 1.

[27369] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM663 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM663 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27370] As mentioned hereinabove with reference to Fig. 1, a function of VGAM663 gene, herein designated VGAM is inhibition of expression of VGAM663 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM663 correlate with, and may be deduced from, the identity of the target genes which VGAM663

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27371] B-cell CLL/lymphoma 7A (BCL7A, Accession NM\_020993) is a VGAM663 host target gene. BCL7A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BCL7A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL7A BINDING SITE, designated SEQ ID:21985, to the nucleotide sequence of VGAM663 RNA, herein designated VGAM RNA, also designated SEQ ID:3374.

[27372] A function of VGAM663 is therefore inhibition of B-cell CLL/lymphoma 7A (BCL7A, Accession NM\_020993). Accordingly, utilities of VGAM663 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL7A. Chloride Channel 4 (CLCN4, Accession NM\_001830) is another VGAM663 host target gene. CLCN4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CLCN4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of CLCN4 BINDING SITE, designated SEQ ID:7573, to the nucleotide sequence of VGAM663 RNA, herein designated VGAM RNA, also designated SEQ ID:3374.

[27373] Another function of VGAM663 is therefore inhibition of Chloride Channel 4 (CLCN4, Accession NM\_001830), a gene which is regulation of cell volume; membrane potential stabilization, signal transduction and transepithelial transport. Accordingly, utilities of VGAM663 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLCN4. The function of CLCN4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM558. Zinc Finger Protein 264 (ZNF264, Accession NM\_003417) is another VGAM663 host target gene. ZNF264 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF264, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF264 BINDING SITE, designated SEQ ID:9458, to the nucleotide sequence of VGAM663 RNA, herein designated VGAM

RNA, also designated SEQ ID:3374.

[27374] Another function of VGAM663 is therefore inhibition of Zinc Finger Protein 264 (ZNF264, Accession NM\_003417). Accordingly, utilities of VGAM663 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF264. DKFZP761F241 (Accession NM\_031455) is another VGAM663 host target gene. DKFZP761F241 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP761F241, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP761F241 BINDING SITE, designated SEQ ID:25474, to the nucleotide sequence of VGAM663 RNA, herein designated VGAM RNA, also designated SEQ ID:3374.

[27375] Another function of VGAM663 is therefore inhibition of DKFZP761F241 (Accession NM\_031455). Accordingly, utilities of VGAM663 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP761F241. FLJ10008 (Accession NM\_017970) is another VGAM663 host target gene. FLJ10008 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by FLJ10008, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10008 BINDING SITE, designated SEQ ID:19690, to the nucleotide sequence of VGAM663 RNA, herein designated VGAM RNA, also designated SEQ ID:3374.

[27376] Another function of VGAM663 is therefore inhibition of FLJ10008 (Accession NM\_017970). Accordingly, utilities of VGAM663 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10008. TSPAN-2 (Accession NM\_005725) is another VGAM663 host target gene. TSPAN-2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TSPAN-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TSPAN-2 BINDING SITE, designated SEQ ID:12279, to the nucleotide sequence of VGAM663 RNA, herein designated VGAM RNA, also designated SEQ ID:3374.

[27377] Another function of VGAM663 is therefore inhibition of TSPAN-2 (Accession NM\_005725). Accordingly, utilities of

VGAM663 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TSPAN-2. Zinc Finger, DHHC Domain Containing 3 (ZDHHC3, Accession NM\_016598) is another VGAM663 host target gene. ZDHHC3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZDHHC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZDHHC3 BINDING SITE, designated SEQ ID:18685, to the nucleotide sequence of VGAM663 RNA, herein designated VGAM RNA, also designated SEQ ID:3374.

[27378] Another function of VGAM663 is therefore inhibition of Zinc Finger, DHHC Domain Containing 3 (ZDHHC3, Accession NM\_016598). Accordingly, utilities of VGAM663 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZDHHC3. LOC205095 (Accession XM\_119820) is another VGAM663 host target gene. LOC205095 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC205095, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC205095 BINDING SITE, designated SEQ ID:43600, to the nucleotide sequence of VGAM663 RNA, herein designated VGAM RNA, also designated SEQ ID:3374.

[27379] Another function of VGAM663 is therefore inhibition of LOC205095 (Accession XM\_119820). Accordingly, utilities of VGAM663 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC205095. LOC221272 (Accession XM\_168050) is another VGAM663 host target gene. LOC221272 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221272, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221272 BINDING SITE, designated SEQ ID:44963, to the nucleotide sequence of VGAM663 RNA, herein designated VGAM RNA, also designated SEQ ID:3374.

[27380] Another function of VGAM663 is therefore inhibition of LOC221272 (Accession XM\_168050). Accordingly, utilities of VGAM663 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC221272. LOC92078 (Accession XM\_042684) is another VGAM663 host target gene. LOC92078 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92078, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92078 BINDING SITE, designated SEQ ID:33739, to the nucleotide sequence of VGAM663 RNA, herein designated VGAM RNA, also designated SEQ ID:3374.

[27381] Another function of VGAM663 is therefore inhibition of LOC92078 (Accession XM\_042684). Accordingly, utilities of VGAM663 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92078. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 664 (VGAM664) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27382] VGAM664 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM664 was detected is described hereinabove with reference to Figs. 1–8.

[27383] VGAM664 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rachiplusia Ou Multiple Nucleopolyhedrovirus. VGAM664 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27384] VGAM664 gene encodes a VGAM664 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM664 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM664 precursor RNA is designated SEQ ID:650, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:650 is located at position 18 relative to the genome of Rachiplusia Ou Multiple Nucleopolyhedrovirus.

[27385] VGAM664 precursor RNA folds onto itself, forming VGAM664 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence

of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27386] An enzyme complex designated DICER COMPLEX, `dices` the VGAM664 folded precursor RNA into VGAM664 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM664 RNA is designated SEQ ID:3375, and is provided hereinbelow with reference to the sequence listing part.

[27387] VGAM664 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM664 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM664 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[27388] VGAM664 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM664 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM664 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM664 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM664 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[27389] The complementary binding of VGAM664 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM664 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM664 host target RNA into VGAM664 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27390] It is appreciated that VGAM664 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM664 host target genes. The mRNA of each one of this plurality of VGAM664 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM664 RNA, herein designated VGAM RNA, and which when bound by VGAM664 RNA causes inhibition of translation of respective one or more VGAM664 host target proteins.

[27391] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM664 gene, herein designated VGAM GENE, on one or more VGAM664 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[27392] It is yet further appreciated that a function of VGAM664 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM664 include diagnosis, prevention and treatment of viral infection by Rachiplusia Ou Multiple Nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM664 correlate with, and may be deduced from, the identity of the host target genes which VGAM664 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27393] Nucleotide sequences of the VGAM664 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM664 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM664 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM664 are further described hereinbelow with reference to Table 1.

[27394] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM664 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM664 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27395] As mentioned hereinabove with reference to Fig. 1, a function of VGAM664 gene, herein designated VGAM is inhibition of expression of VGAM664 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM664 correlate with, and may be deduced from, the identity of the target genes which VGAM664 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27396] BCMP1 (Accession NM\_031442) is a VGAM664 host target gene. BCMP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BCMP1, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCMP1 BINDING SITE, designated SEQ ID:25458, to the nucleotide sequence of VGAM664 RNA, herein designated VGAM RNA, also designated SEQ ID:3375.

[27397] A function of VGAM664 is therefore inhibition of BCMP1 (Accession NM\_031442). Accordingly, utilities of VGAM664 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCMP1. FLJ20294 (Accession NM\_017749) is another VGAM664 host target gene. FLJ20294 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20294, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20294 BINDING SITE, designated SEQ ID:19350, to the nucleotide sequence of VGAM664 RNA, herein designated VGAM RNA, also designated SEQ ID:3375.

[27398] Another function of VGAM664 is therefore inhibition of FLJ20294 (Accession NM\_017749). Accordingly, utilities of VGAM664 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FLJ20294. KIAA0446 (Accession XM\_044155) is another VGAM664 host target gene. KIAA0446 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0446, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0446 BINDING SITE, designated SEQ ID:34145, to the nucleotide sequence of VGAM664 RNA, herein designated VGAM RNA, also designated SEQ ID:3375.

[27399] Another function of VGAM664 is therefore inhibition of KIAA0446 (Accession XM\_044155). Accordingly, utilities of VGAM664 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0446. START Domain Containing 7 (STARD7, Accession NM\_139267) is another VGAM664 host target gene. STARD7 BINDING SITE1 and STARD7 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by STARD7, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STARD7 BINDING

SITE1 and STARD7 BINDING SITE2, designated SEQ ID:29258 and SEQ ID:21354 respectively, to the nucleotide sequence of VGAM664 RNA, herein designated VGAM RNA, also designated SEQ ID:3375.

[27400] Another function of VGAM664 is therefore inhibition of START Domain Containing 7 (STARD7, Accession NM\_139267). Accordingly, utilities of VGAM664 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STARD7. LOC122786 (Accession XM\_058660) is another VGAM664 host target gene. LOC122786 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC122786, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC122786 BINDING SITE, designated SEQ ID:36698, to the nucleotide sequence of VGAM664 RNA, herein designated VGAM RNA, also designated SEQ ID:3375.

[27401] Another function of VGAM664 is therefore inhibition of LOC122786 (Accession XM\_058660). Accordingly, utilities of VGAM664 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC122786. LOC158696 (Accession XM\_088644) is another VGAM664 host target gene. LOC158696 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158696, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158696 BINDING SITE, designated SEQ ID:39881, to the nucleotide sequence of VGAM664 RNA, herein designated VGAM RNA, also designated SEQ ID:3375.

[27402] Another function of VGAM664 is therefore inhibition of LOC158696 (Accession XM\_088644). Accordingly, utilities of VGAM664 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158696. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 665 (VGAM665) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27403] VGAM665 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM665 was detected is described hereinabove with reference to Figs. 1–8.

[27404] VGAM665 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rachiplusia Ou Multiple Nucleopolyhedrovirus. VGAM665 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27405] VGAM665 gene encodes a VGAM665 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM665 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM665 precursor RNA is designated SEQ ID:651, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:651 is located at position 235 relative to the genome of Rachiplusia Ou Multiple Nucleopolyhedrovirus.

[27406] VGAM665 precursor RNA folds onto itself, forming VGAM665 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence

of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27407] An enzyme complex designated DICER COMPLEX, `dices` the VGAM665 folded precursor RNA into VGAM665 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM665 RNA is designated SEQ ID:3376, and is provided hereinbelow with reference to the sequence listing part.

[27408] VGAM665 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM665 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM665 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[27409] VGAM665 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM665 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM665 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM665 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM665 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[27410] The complementary binding of VGAM665 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM665 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM665 host target RNA into VGAM665 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27411] It is appreciated that VGAM665 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM665 host target genes. The mRNA of each one of this plurality of VGAM665 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM665 RNA, herein designated VGAM RNA, and which when bound by VGAM665 RNA causes inhibition of translation of respective one or more VGAM665 host target proteins.

[27412] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM665 gene, herein designated VGAM GENE, on one or more VGAM665 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[27413] It is yet further appreciated that a function of VGAM665 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM665 include diagnosis, prevention and treatment of viral infection by Rachiplusia Ou Multiple Nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM665 correlate with, and may be deduced from, the identity of the host target genes which VGAM665 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27414] Nucleotide sequences of the VGAM665 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM665 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM665 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM665 are further described hereinbelow with reference to Table 1.

[27415] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM665 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM665 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27416] As mentioned hereinabove with reference to Fig. 1, a function of VGAM665 gene, herein designated VGAM is inhibition of expression of VGAM665 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM665 correlate with, and may be deduced from, the identity of the target genes which VGAM665 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27417] ATPase, Class VI, Type 11B (ATP11B, Accession XM\_087254) is a VGAM665 host target gene. ATP11B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP11B, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP11B BINDING SITE, designated SEQ ID:39144, to the nucleotide sequence of VGAM665 RNA, herein designated VGAM RNA, also designated SEQ ID:3376.

[27418] A function of VGAM665 is therefore inhibition of ATPase, Class VI, Type 11B (ATP11B, Accession XM\_087254), a gene which is phosphorylated in their intermediate state, drives uphill transport of ions across membranes. Accordingly, utilities of VGAM665 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP11B. The function of ATP11B has been established by previous studies. Nagase et al. (1999) isolated a partial cDNA encoding ATP11B, which they called KIAA0956, from a brain cDNA library. Based on homology analysis, they predicted that the KIAA0956 protein is a chromaffin granule ATPase. RT-PCR analysis detected wide expression, with highest levels in kidney, followed by ovary, corpus callosum, and testis. RUSH proteins are SWI/SNF-related transcription factors with uteroglobin promoter-binding RING finger signatures near their C termini (see OMIM Ref. No. 603257). Mansharamani et al. (2001)

isolated a nearly full-length rabbit cDNA encoding Rfbp, a RUSH-binding protein that shares 93% amino acid identity with KIAA0956.

[27419] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[27420] Nagase, T.; Ishikawa, K.; Suyama, M.; Kikuno, R.; Hiro-sawa, M.; Miyajima, N.; Tanaka, A.; Kotani, H.; Nomura, N.; Ohara, O. : Prediction of the coding sequences of unidentified human genes. XIII. The complete sequences of 100 new cDNA clones from brain which code for large proteins in vitro. DNA Res. 6: 63-70, 1999. ; and

[27421] Mansharamani, M.; Hewetson, A.; Chilton, B. S. : Cloning and characterization of an atypical type IV P-type ATPase that binds to the RING motif of RUSH transcription factors. J. Biol. C.

[27422] Further studies establishing the function and utilities of ATP11B are found in John Hopkins OMIM database record ID 605869, and in cited publications numbered 6623, 700 and 8593 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. B-cell CLL/lymphoma 2 (BCL2, Accession NM\_000633) is another VGAM665 host target gene. BCL2 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BCL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL2 BINDING SITE, designated SEQ ID:6260, to the nucleotide sequence of VGAM665 RNA, herein designated VGAM RNA, also designated SEQ ID:3376.

[27423] Another function of VGAM665 is therefore inhibition of B-cell CLL/lymphoma 2 (BCL2, Accession NM\_000633). Accordingly, utilities of VGAM665 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL2. F-box and Leucine-rich Repeat Protein 5 (FBXL5, Accession NM\_012161) is another VGAM665 host target gene. FBXL5 BINDING SITE1 and FBXL5 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FBXL5, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBXL5 BINDING SITE1 and FBXL5 BINDING SITE2, designated SEQ ID:14461 and SEQ ID:27303 respectively, to the nucleotide sequence of VGAM665 RNA,

herein designated VGAM RNA, also designated SEQ ID:3376.

[27424] Another function of VGAM665 is therefore inhibition of F-box and Leucine-rich Repeat Protein 5 (FBXL5, Accession NM\_012161), a gene which is a putative SCF ubiquitin ligase subunit involved in protein degradation. Accordingly, utilities of VGAM665 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXL5. The function of FBXL5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM61. Fibroblast Growth Factor 5 (FGF5, Accession NM\_033143) is another VGAM665 host target gene. FGF5 BINDING SITE1 and FGF5 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FGF5, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGF5 BINDING SITE1 and FGF5 BINDING SITE2, designated SEQ ID:27003 and SEQ ID:7782 respectively, to the nucleotide sequence of VGAM665 RNA, herein designated VGAM RNA, also designated SEQ ID:3376.

[27425] Another function of VGAM665 is therefore inhibition of Fibroblast Growth Factor 5 (FGF5, Accession NM\_033143), a gene which induces transformation and may regulate neuronal differentiation. Accordingly, utilities of VGAM665 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGF5. The function of FGF5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM276. Interleukin 1 Receptor Antagonist (IL1RN, Accession NM\_000577) is another VGAM665 host target gene. IL1RN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL1RN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL1RN BINDING SITE, designated SEQ ID:6177, to the nucleotide sequence of VGAM665 RNA, herein designated VGAM RNA, also designated SEQ ID:3376.

[27426] Another function of VGAM665 is therefore inhibition of Interleukin 1 Receptor Antagonist (IL1RN, Accession NM\_000577), a gene which inhibits the activity of il-1 by binding to its receptor. il-1ra has no il-1 like activity. Ac-

cordingly, utilities of VGAM665 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL1RN. The function of IL1RN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM193. Protein Phosphatase 1, Catalytic Subunit, Beta Isoform (PPP1CB, Accession NM\_002709) is another VGAM665 host target gene. PPP1CB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP1CB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1CB BINDING SITE, designated SEQ ID:8560, to the nucleotide sequence of VGAM665 RNA, herein designated VGAM RNA, also designated SEQ ID:3376.

[27427] Another function of VGAM665 is therefore inhibition of Protein Phosphatase 1, Catalytic Subunit, Beta Isoform (PPP1CB, Accession NM\_002709), a gene which is the catalytic subunit of protein phosphatase 1. Accordingly, utilities of VGAM665 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

PPP1CB. The function of PPP1CB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM46. Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM\_000450) is another VGAM665 host target gene. SELE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SELE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SELE BINDING SITE, designated SEQ ID:6052, to the nucleotide sequence of VGAM665 RNA, herein designated VGAM RNA, also designated SEQ ID:3376.

[27428] Another function of VGAM665 is therefore inhibition of Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM\_000450), a gene which expressed on cytokine induced endothelial cells and mediates their binding to leukocytes. Accordingly, utilities of VGAM665 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SELE. The function of SELE and its association with various diseases and clinical conditions, has been established by previous studies, as de-

scribed hereinabove with reference to VGAM508. Single-minded Homolog 1 (Drosophila) (SIM1, Accession NM\_005068) is another VGAM665 host target gene. SIM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SIM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIM1 BINDING SITE, designated SEQ ID:11512, to the nucleotide sequence of VGAM665 RNA, herein designated VGAM RNA, also designated SEQ ID:3376.

[27429] Another function of VGAM665 is therefore inhibition of Single-minded Homolog 1 (Drosophila) (SIM1, Accession NM\_005068), a gene which may have pleiotropic effects during embryogenesis and in the adult. Accordingly, utilities of VGAM665 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIM1. The function of SIM1 has been established by previous studies. Studies of mice and humans have revealed a number of genes that when mutated result in severe obesity. Holder et al. (2000) studied a girl with early-onset obesity and a balanced translocation between 1p22.1 and 6q16.2. At 67 months of age she weighed 47.5 kg (+9.3

SD) and was 127.2 cm tall (+3.2 SD); her weight for height was +6.3 SD. The child displayed an aggressive, voracious appetite, and the obesity was thought to be due to high intake, since measured energy expenditure was normal. Holder et al. (2000) cloned and sequenced both translocation breakpoints. The translocation did not appear to affect any transcription unit on 1p, but it disrupted the SIM1 gene on 6q, separating the 5-prime promoter region and the bHLH domain from the 3-prime PAS and putative transcriptional regulation domains. The transcriptional targets of SIM1 were not known. Mouse Sim1 is expressed in the developing kidney and central nervous system and is essential for formation of the supraoptic and paraventricular (PVN) nuclei of the hypothalamus. Previous neuroanatomic and pharmacologic studies had implicated the PVN in the regulation of body weight: PVN neurons express the melanocortin-4 receptor (MC4R; 155541) and appear to be physiologic targets of alpha-melanocyte-stimulating hormone (OMIM Ref. No. 176830), which inhibits food intake. Holder et al. (2000) hypothesized that haploinsufficiency of SIM1, possibly acting upstream or downstream of MC4R in the PVN, was responsible for severe obesity in their patient. Animal

model experiments lend further support to the function of SIM1. Mice homozygous for a null allele of Sim1 (Sim1 – /–) lack a paraventricular nucleus (PVN) and die perinatally. In contrast, Michaud et al. (2001) showed that Sim1 heterozygous mice were viable but developed early-onset obesity, with increased linear growth, hyperinsulinemia, and hyperleptinemia. Sim1 +/- mice were hyperphagic but their energy expenditure was not decreased, distinguishing them from other mouse models of early-onset obesity such as deficiencies in leptin (OMIM Ref. No. 164160) and melanocortin receptor-4 (OMIM Ref. No. 155541). Quantitative histologic comparison with normal littermates showed that the PVN of Sim1 +/- mice contains on average 24% fewer cells without a selective loss of any identifiable major cell type. Since acquired lesions in the PVN also induce increased appetite without a decrease in energy expenditure, the authors proposed that abnormalities of PVN development may cause the obesity of Sim1 +/- mice.

[27430] It is appreciated that the abovementioned animal model for SIM1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[27431] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[27432] Holder, J. L., Jr.; Butte, N. F.; Zinn, A. R. : Profound obesity associated with a balanced translocation that disrupts the SIM1 gene. Hum. Molec. Genet. 9: 101–108, 2000. ; and

[27433] Michaud, J. L.; Boucher, F.; Melnyk, A.; Gauthier, F.; Goshu, E.; Levy, E.; Mitchell, G. A.; Himms–Hagen, J.; Fan, C.–M. : Sim1 haploinsufficiency causes hyperphagia, obesity and redu.

[27434] Further studies establishing the function and utilities of SIM1 are found in John Hopkins OMIM database record ID 603128, and in cited publications numbered 64 and 647–646 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Visual System Homeobox 1 Homolog, CHX10–like (zebrafish) (VSX1, Accession NM\_014588) is another VGAM665 host target gene. VSX1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by VSX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VSX1 BINDING SITE, designated SEQ

ID:15955, to the nucleotide sequence of VGAM665 RNA, herein designated VGAM RNA, also designated SEQ ID:3376.

[27435] Another function of VGAM665 is therefore inhibition of Visual System Homeobox 1 Homolog, CHX10-like (zebrafish) (VSX1, Accession NM\_014588), a gene which is implicated in ocular development. Accordingly, utilities of VGAM665 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VSX1. The function of VSX1 has been established by previous studies. Using a yeast 1-hybrid screen of an adult bovine retinal cDNA library with the conserved core of the red/green visual pigment locus control region (see OMIM Ref. No. CBD; 303800) as bait, followed by RT-PCR of a human retinal library, Hayashi et al. (2000) isolated a cDNA encoding VSX1, which they termed RINX for 'retinal inner nuclear layer (INL) homeo box.' Hayashi et al. (2000) also identified 5 splice variants of VSX1. RT-PCR analysis indicated that the 2 major VSX1 transcripts are expressed in retina and WERI, a retinoblastoma cell line expressing retinal cone genes, but not in other tissues or in a rhodopsin-expressing retinoblastoma cell line. Northern blot analysis detected a 2.0-kb main VSX1 transcript in

retina but not heart. In situ hybridization analysis of bovine retinal sections demonstrated exclusive localization of VSX1 to cell nuclei in the middle of the INL, likely belonging to bipolar cells. By PCR of a human embryonic craniofacial cDNA library using degenerate oligonucleotides based on highly conserved motifs within the paired-like homeodomain, Semina et al. (2000) isolated a cDNA encoding VSX1. The predicted 365-amino acid VSX1 protein contains a paired-like homeodomain and a CVC domain. Human VSX1 shares 55% overall sequence identity with the zebrafish and goldfish Vsx1 proteins and 35% overall identity with the goldfish Vsx2 and mouse Chx10 proteins. PCR of a panel of cDNA libraries detected VSX1 expression in embryonic craniofacial, adult retina, and adult cornea libraries but not in adult lens, embryonic or adult brain, heart, kidney, liver, lung, skeletal muscle, spleen, or thymus libraries.

[27436] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[27437] Hayashi, T.; Huang, J.; Deeb, S. S. : RINX(VSX1), a novel homeobox gene expressed in the inner nuclear layer of the adult retina. *Genomics* 67: 128–139, 2000. ; and

[27438] Semina, E. V.; Mintz-Hittner, H. A.; Murray, J. C. : Isolation and characterization of a novel human paired-like home-domain-containing transcription factor gene, VSX1, expressed in ocula.

[27439] Further studies establishing the function and utilities of VSX1 are found in John Hopkins OMIM database record ID 605020, and in cited publications numbered 4387-4389 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Zinc Finger Protein 264 (ZNF264, Accession NM\_003417) is another VGAM665 host target gene. ZNF264 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF264, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF264 BINDING SITE, designated SEQ ID:9459, to the nucleotide sequence of VGAM665 RNA, herein designated VGAM RNA, also designated SEQ ID:3376.

[27440] Another function of VGAM665 is therefore inhibition of Zinc Finger Protein 264 (ZNF264, Accession NM\_003417). Accordingly, utilities of VGAM665 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with ZNF264. DKFZP564O0463 (Accession NM\_014156) is another VGAM665 host target gene. DKFZP564O0463 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564O0463, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564O0463 BINDING SITE, designated SEQ ID:15441, to the nucleotide sequence of VGAM665 RNA, herein designated VGAM RNA, also designated SEQ ID:3376.

[27441] Another function of VGAM665 is therefore inhibition of DKFZP564O0463 (Accession NM\_014156). Accordingly, utilities of VGAM665 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564O0463. KIAA0226 (Accession XM\_032901) is another VGAM665 host target gene. KIAA0226 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0226, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0226 BINDING SITE, designated SEQ ID:31787, to the

nucleotide sequence of VGAM665 RNA, herein designated VGAM RNA, also designated SEQ ID:3376.

[27442] Another function of VGAM665 is therefore inhibition of KIAA0226 (Accession XM\_032901). Accordingly, utilities of VGAM665 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0226. KIAA0534 (Accession XM\_049349) is another VGAM665 host target gene. KIAA0534 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0534, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0534 BINDING SITE, designated SEQ ID:35377, to the nucleotide sequence of VGAM665 RNA, herein designated VGAM RNA, also designated SEQ ID:3376.

[27443] Another function of VGAM665 is therefore inhibition of KIAA0534 (Accession XM\_049349). Accordingly, utilities of VGAM665 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0534. KIAA1193 (Accession XM\_041843) is another VGAM665 host target gene. KIAA1193 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA1193, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1193 BINDING SITE, designated SEQ ID:33579, to the nucleotide sequence of VGAM665 RNA, herein designated VGAM RNA, also designated SEQ ID:3376.

[27444] Another function of VGAM665 is therefore inhibition of KIAA1193 (Accession XM\_041843). Accordingly, utilities of VGAM665 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1193. KIAA1622 (Accession NM\_058237) is another VGAM665 host target gene. KIAA1622 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1622, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1622 BINDING SITE, designated SEQ ID:27765, to the nucleotide sequence of VGAM665 RNA, herein designated VGAM RNA, also designated SEQ ID:3376.

[27445] Another function of VGAM665 is therefore inhibition of KIAA1622 (Accession NM\_058237). Accordingly, utilities

of VGAM665 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1622. LOC116064 (Accession XM\_057296) is another VGAM665 host target gene. LOC116064 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC116064, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC116064 BINDING SITE, designated SEQ ID:36496, to the nucleotide sequence of VGAM665 RNA, herein designated VGAM RNA, also designated SEQ ID:3376.

[27446] Another function of VGAM665 is therefore inhibition of LOC116064 (Accession XM\_057296). Accordingly, utilities of VGAM665 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC116064. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 666 (VGAM666) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27447] VGAM666 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM666 was detected is described hereinabove with reference to Figs. 1–8.

[27448] VGAM666 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Yaba-like Disease Virus. VGAM666 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27449] VGAM666 gene encodes a VGAM666 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM666 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM666 precursor RNA is designated SEQ ID:652, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:652 is located at position 27927 relative to the genome of Yaba-like Disease Virus.

[27450] VGAM666 precursor RNA folds onto itself, forming VGAM666 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this

‘hairpin structure’, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed–reversed sequence of the nucleotide sequence of the second half thereof.

[27451] An enzyme complex designated DICER COMPLEX, ‘dices’ the VGAM666 folded precursor RNA into VGAM666 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, ‘dicing’ of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of VGAM666 RNA is designated SEQ ID:3377, and is provided hereinbelow with reference to the sequence listing part.

[27452] VGAM666 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM666 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM666 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5’ untranslated region, a protein coding region and a 3’ untranslated region, designated 5’UTR, PROTEIN

CODING and 3`UTR respectively.

[27453] VGAM666 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM666 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM666 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM666 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM666 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[27454] The complementary binding of VGAM666 RNA, herein designated VGAM RNA, to host target binding sites on VGAM666 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM666 host target RNA into VGAM666 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27455] It is appreciated that VGAM666 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM666 host target genes. The mRNA of each one of this plurality of VGAM666 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM666 RNA, herein designated VGAM RNA, and which when bound by VGAM666 RNA causes inhibition of translation of respective one or more VGAM666 host target proteins.

[27456] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM666 gene, herein designated VGAM GENE, on one or more VGAM666 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[27457] It is yet further appreciated that a function of VGAM666 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM666 include diagnosis, prevention and treatment of viral infection by Yaba-like Disease Virus. Specific functions, and accordingly utilities, of VGAM666 correlate with, and may be deduced from, the identity of the host target genes which VGAM666 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27458] Nucleotide sequences of the VGAM666 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the  
`diced` VGAM666 RNA, herein designated VGAM RNA,  
and a schematic representation of the secondary folding  
of VGAM666 folded precursor RNA, herein designated  
VGAM FOLDED PRECURSOR RNA, of VGAM666 are further  
described hereinbelow with reference to Table 1.

[27459] Nucleotide sequences of host target binding sites, such as  
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of  
Fig. 1, found on VGAM666 host target RNA, and schematic  
representation of the complementarity of each of these  
host target binding sites to VGAM666 RNA, herein desig-  
nated VGAM RNA, are described hereinbelow with refer-  
ence to Table 2.

[27460] As mentioned hereinabove with reference to Fig. 1, a  
function of VGAM666 gene, herein designated VGAM is  
inhibition of expression of VGAM666 target genes. It is  
appreciated that specific functions, and accordingly utili-  
ties, of VGAM666 correlate with, and may be deduced  
from, the identity of the target genes which VGAM666  
binds and inhibits, and the function of these target genes,  
as elaborated hereinbelow.

[27461] A Kinase (PRKA) Anchor Protein 13 (AKAP13, Accession  
XM\_116974) is a VGAM666 host target gene. AKAP13

BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AKAP13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKAP13 BINDING SITE, designated SEQ ID:43175, to the nucleotide sequence of VGAM666 RNA, herein designated VGAM RNA, also designated SEQ ID:3377.

[27462] A function of VGAM666 is therefore inhibition of A Kinase (PRKA) Anchor Protein 13 (AKAP13, Accession XM\_116974), a gene which regulates subcellular localization of type II cAMP-dependent PKA. Accordingly, utilities of VGAM666 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP13. The function of AKAP13 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM17. Ret Proto-oncogene (multiple endocrine neoplasia and medullary thyroid carcinoma 1, Hirschsprung disease) (RET, Accession NM\_020630) is another VGAM666 host target gene. RET BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RET, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RET BINDING SITE, designated SEQ ID:21781, to the nucleotide sequence of VGAM666 RNA, herein designated VGAM RNA, also designated SEQ ID:3377.

[27463] Another function of VGAM666 is therefore inhibition of Ret Proto-oncogene (multiple endocrine neoplasia and medullary thyroid carcinoma 1, Hirschsprung disease) (RET, Accession NM\_020630), a gene which transduces signals for cell growth and differentiation. Accordingly, utilities of VGAM666 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RET. The function of RET and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM381. Zinc Finger, DHHC Domain Containing 2 (ZDHHC2, Accession NM\_016353) is another VGAM666 host target gene. ZDHHC2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZDHHC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of ZDHHC2 BINDING SITE, designated SEQ ID:18485, to the nucleotide sequence of VGAM666 RNA, herein designated VGAM RNA, also designated SEQ ID:3377.

[27464] Another function of VGAM666 is therefore inhibition of Zinc Finger, DHHC Domain Containing 2 (ZDHHC2, Accession NM\_016353). Accordingly, utilities of VGAM666 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZDHHC2. LOC158263 (Accession XM\_088530) is another VGAM666 host target gene. LOC158263 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158263, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158263 BINDING SITE, designated SEQ ID:39796, to the nucleotide sequence of VGAM666 RNA, herein designated VGAM RNA, also designated SEQ ID:3377.

[27465] Another function of VGAM666 is therefore inhibition of LOC158263 (Accession XM\_088530). Accordingly, utilities of VGAM666 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC158263. LOC221656 (Accession XM\_166418) is another VGAM666 host target gene. LOC221656 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221656, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221656 BINDING SITE, designated SEQ ID:44291, to the nucleotide sequence of VGAM666 RNA, herein designated VGAM RNA, also designated SEQ ID:3377.

[27466] Another function of VGAM666 is therefore inhibition of LOC221656 (Accession XM\_166418). Accordingly, utilities of VGAM666 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221656. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 667 (VGAM667) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27467] VGAM667 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM667 was detected is described hereinabove with reference to Figs. 1–8.

[27468] VGAM667 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus.

VGAM667 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27469] VGAM667 gene encodes a VGAM667 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM667 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM667 precursor RNA is designated SEQ ID:653, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:653 is located at position 242236 relative to the genome of Fowlpox Virus.

[27470] VGAM667 precursor RNA folds onto itself, forming VGAM667 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence

of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27471] An enzyme complex designated DICER COMPLEX, `dices` the VGAM667 folded precursor RNA into VGAM667 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM667 RNA is designated SEQ ID:3378, and is provided hereinbelow with reference to the sequence listing part.

[27472] VGAM667 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM667 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM667 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[27473] VGAM667 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM667 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM667 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM667 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM667 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[27474] The complementary binding of VGAM667 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM667 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM667 host target RNA into VGAM667 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27475] It is appreciated that VGAM667 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM667 host target genes. The mRNA of each one of this plurality of VGAM667 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM667 RNA, herein designated VGAM RNA, and which when bound by VGAM667 RNA causes inhibition of translation of respective one or more VGAM667 host target proteins.

[27476] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM667 gene, herein designated VGAM GENE, on one or more VGAM667 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[27477] It is yet further appreciated that a function of VGAM667 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM667 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM667 correlate with, and may be deduced from, the identity of the host target genes which VGAM667 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27478] Nucleotide sequences of the VGAM667 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM667 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM667 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM667 are further described hereinbelow with reference to Table 1.

[27479] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM667 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM667 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27480] As mentioned hereinabove with reference to Fig. 1, a function of VGAM667 gene, herein designated VGAM is inhibition of expression of VGAM667 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM667 correlate with, and may be deduced from, the identity of the target genes which VGAM667 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27481] Glucose-6-phosphatase, Catalytic (glycogen storage disease type I, von Gierke disease) (G6PC, Accession NM\_000151) is a VGAM667 host target gene. G6PC BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by G6PC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of G6PC BINDING SITE, designated SEQ ID:5653, to the nucleotide sequence of VGAM667 RNA, herein designated VGAM RNA, also designated SEQ ID:3378.

[27482] A function of VGAM667 is therefore inhibition of Glucose-6-phosphatase, Catalytic (glycogen storage disease type I, von Gierke disease) (G6PC, Accession NM\_000151). Accordingly, utilities of VGAM667 include diagnosis, prevention and treatment of diseases and clinical conditions associated with G6PC. Solute Carrier Family 16 (monocarboxylic acid transporters), Member 2 (putative transporter) (SLC16A2, Accession NM\_006517) is another VGAM667 host target gene. SLC16A2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC16A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC16A2 BINDING SITE, designated SEQ ID:13266, to the nucleotide sequence of VGAM667 RNA, herein designated VGAM

RNA, also designated SEQ ID:3378.

[27483] Another function of VGAM667 is therefore inhibition of Solute Carrier Family 16 (monocarboxylic acid transporters), Member 2 (putative transporter) (SLC16A2, Accession NM\_006517). Accordingly, utilities of VGAM667 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC16A2.

LOC140139 (Accession XM\_067102) is another VGAM667 host target gene. LOC140139 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC140139, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC140139 BINDING SITE, designated SEQ ID:37347, to the nucleotide sequence of VGAM667 RNA, herein designated VGAM RNA, also designated SEQ ID:3378.

[27484] Another function of VGAM667 is therefore inhibition of LOC140139 (Accession XM\_067102). Accordingly, utilities of VGAM667 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC140139. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 668 (VGAM668) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27485] VGAM668 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM668 was detected is described hereinabove with reference to Figs. 1–8.

[27486] VGAM668 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus.

VGAM668 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27487] VGAM668 gene encodes a VGAM668 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM668 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM668 precursor RNA is designated SEQ ID:654, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:654 is located at position 267154 relative to the genome of

## Fowlpox Virus.

[27488] VGAM668 precursor RNA folds onto itself, forming VGAM668 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27489] An enzyme complex designated DICER COMPLEX, `dices` the VGAM668 folded precursor RNA into VGAM668 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 74%) nucleotide sequence of VGAM668 RNA is designated SEQ ID:3379, and is provided hereinbelow with reference to the sequence listing part.

[27490] VGAM668 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM668 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM668 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[27491] VGAM668 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM668 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM668 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM668 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM668 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[27492] The complementary binding of VGAM668 RNA, herein designated VGAM RNA, to host target binding sites on VGAM668 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM668 host target RNA into VGAM668 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27493] It is appreciated that VGAM668 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM668 host target genes. The mRNA of each one of this plurality of VGAM668 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM668 RNA, herein designated VGAM RNA, and which when bound by VGAM668 RNA causes inhibition of translation of respective one or more VGAM668 host target proteins.

[27494] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM668 gene, herein designated VGAM GENE, on one or more VGAM668 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[27495] It is yet further appreciated that a function of VGAM668 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM668 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM668 correlate

with, and may be deduced from, the identity of the host target genes which VGAM668 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27496] Nucleotide sequences of the VGAM668 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM668 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM668 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM668 are further described hereinbelow with reference to Table 1.

[27497] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM668 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM668 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27498] As mentioned hereinabove with reference to Fig. 1, a function of VGAM668 gene, herein designated VGAM is inhibition of expression of VGAM668 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM668 correlate with, and may be deduced

from, the identity of the target genes which VGAM668 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27499] Golgi Complex Associated Protein 1, 60kDa (GOCAP1, Accession NM\_022735) is a VGAM668 host target gene. GOCAP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GOCAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GOCAP1 BINDING SITE, designated SEQ ID:22940, to the nucleotide sequence of VGAM668 RNA, herein designated VGAM RNA, also designated SEQ ID:3379.

[27500] A function of VGAM668 is therefore inhibition of Golgi Complex Associated Protein 1, 60kDa (GOCAP1, Accession NM\_022735). Accordingly, utilities of VGAM668 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GOCAP1. Leucine Zipper Transcription Factor-like 1 (LZTFL1, Accession NM\_020347) is another VGAM668 host target gene. LZTFL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

LZTFL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LZTFL1 BINDING SITE, designated SEQ ID:21598, to the nucleotide sequence of VGAM668 RNA, herein designated VGAM RNA, also designated SEQ ID:3379.

[27501] Another function of VGAM668 is therefore inhibition of Leucine Zipper Transcription Factor-like 1 (LZTFL1, Accession NM\_020347). Accordingly, utilities of VGAM668 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LZTFL1. Solute Carrier Family 13 (sodium/sulfate symporters), Member 1 (SLC13A1, Accession NM\_022444) is another VGAM668 host target gene. SLC13A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC13A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC13A1 BINDING SITE, designated SEQ ID:22777, to the nucleotide sequence of VGAM668 RNA, herein designated VGAM RNA, also designated SEQ ID:3379.

[27502] Another function of VGAM668 is therefore inhibition of Solute Carrier Family 13 (sodium/sulfate symporters), Member 1 (SLC13A1, Accession NM\_022444). Accordingly, utilities of VGAM668 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC13A1. DKFZp547I224 (Accession NM\_020221) is another VGAM668 host target gene. DKFZp547I224 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp547I224, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547I224 BINDING SITE, designated SEQ ID:21475, to the nucleotide sequence of VGAM668 RNA, herein designated VGAM RNA, also designated SEQ ID:3379.

[27503] Another function of VGAM668 is therefore inhibition of DKFZp547I224 (Accession NM\_020221). Accordingly, utilities of VGAM668 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547I224. FLJ12331 (Accession NM\_024986) is another VGAM668 host target gene. FLJ12331 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by FLJ12331, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12331 BINDING SITE, designated SEQ ID:24542, to the nucleotide sequence of VGAM668 RNA, herein designated VGAM RNA, also designated SEQ ID:3379.

[27504] Another function of VGAM668 is therefore inhibition of FLJ12331 (Accession NM\_024986). Accordingly, utilities of VGAM668 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12331. FLJ20220 (Accession NM\_017718) is another VGAM668 host target gene. FLJ20220 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20220, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20220 BINDING SITE, designated SEQ ID:19304, to the nucleotide sequence of VGAM668 RNA, herein designated VGAM RNA, also designated SEQ ID:3379.

[27505] Another function of VGAM668 is therefore inhibition of FLJ20220 (Accession NM\_017718). Accordingly, utilities of

VGAM668 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20220. Oxysterol Binding Protein-like 3 (OSBPL3, Accession NM\_015550) is another VGAM668 host target gene. OSBPL3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OSBPL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSBPL3 BINDING SITE, designated SEQ ID:17820, to the nucleotide sequence of VGAM668 RNA, herein designated VGAM RNA, also designated SEQ ID:3379.

[27506] Another function of VGAM668 is therefore inhibition of Oxysterol Binding Protein-like 3 (OSBPL3, Accession NM\_015550). Accordingly, utilities of VGAM668 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL3. TSPAN-3 (Accession NM\_005724) is another VGAM668 host target gene. TSPAN-3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TSPAN-3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of TSPAN-3 BINDING SITE, designated SEQ ID:12277, to the nucleotide sequence of VGAM668 RNA, herein designated VGAM RNA, also designated SEQ ID:3379.

[27507] Another function of VGAM668 is therefore inhibition of TSPAN-3 (Accession NM\_005724). Accordingly, utilities of VGAM668 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TSPAN-3. LOC122830 (Accession XM\_058661) is another VGAM668 host target gene. LOC122830 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC122830, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC122830 BINDING SITE, designated SEQ ID:36707, to the nucleotide sequence of VGAM668 RNA, herein designated VGAM RNA, also designated SEQ ID:3379.

[27508] Another function of VGAM668 is therefore inhibition of LOC122830 (Accession XM\_058661). Accordingly, utilities of VGAM668 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC122830. LOC138199 (Accession XM\_059950) is another VGAM668 host target gene. LOC138199 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC138199, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC138199 BINDING SITE, designated SEQ ID:37119, to the nucleotide sequence of VGAM668 RNA, herein designated VGAM RNA, also designated SEQ ID:3379.

[27509] Another function of VGAM668 is therefore inhibition of LOC138199 (Accession XM\_059950). Accordingly, utilities of VGAM668 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC138199. LOC158357 (Accession XM\_088553) is another VGAM668 host target gene. LOC158357 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158357, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158357 BINDING SITE, designated SEQ ID:39821, to the nucleotide sequence of VGAM668 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3379.

[27510] Another function of VGAM668 is therefore inhibition of LOC158357 (Accession XM\_088553). Accordingly, utilities of VGAM668 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158357. LOC221687 (Accession XM\_166423) is another VGAM668 host target gene. LOC221687 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221687, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221687 BINDING SITE, designated SEQ ID:44309, to the nucleotide sequence of VGAM668 RNA, herein designated VGAM RNA, also designated SEQ ID:3379.

[27511] Another function of VGAM668 is therefore inhibition of LOC221687 (Accession XM\_166423). Accordingly, utilities of VGAM668 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221687. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 669 (VGAM669) viral gene, which modu-

lates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27512] VGAM669 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM669 was detected is described hereinabove with reference to Figs. 1–8.

[27513] VGAM669 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Yaba-like Disease Virus. VGAM669 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27514] VGAM669 gene encodes a VGAM669 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM669 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM669 precursor RNA is designated SEQ ID:655, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:655 is located at position 42333 relative to the genome of Yaba-like Disease Virus.

[27515] VGAM669 precursor RNA folds onto itself, forming

VGAM669 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27516] An enzyme complex designated DICER COMPLEX, `dices` the VGAM669 folded precursor RNA into VGAM669 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM669 RNA is designated SEQ ID:3380, and is provided hereinbelow with reference to the sequence listing part.

[27517] VGAM669 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM669 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM669 host target RNA comprises

three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[27518] VGAM669 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM669 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM669 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM669 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM669 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[27519] The complementary binding of VGAM669 RNA, herein designated VGAM RNA, to host target binding sites on VGAM669 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM669 host target RNA into VGAM669 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27520] It is appreciated that VGAM669 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM669 host target genes. The mRNA of each one of this plurality of VGAM669 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM669 RNA, herein designated VGAM RNA, and which when bound by VGAM669 RNA causes inhibition of translation of respective one or more VGAM669 host target proteins.

[27521] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM669 gene, herein designated VGAM GENE, on one or more VGAM669 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[27522] It is yet further appreciated that a function of VGAM669 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM669 include diagnosis, prevention and treatment of viral infection by Yaba-like Disease Virus. Specific functions, and accordingly utilities, of VGAM669 correlate with, and may be deduced from, the identity of the host target genes which VGAM669 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[27523] Nucleotide sequences of the VGAM669 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM669 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM669 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM669 are further described hereinbelow with reference to Table 1.

[27524] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM669 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM669 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27525] As mentioned hereinabove with reference to Fig. 1, a function of VGAM669 gene, herein designated VGAM is inhibition of expression of VGAM669 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM669 correlate with, and may be deduced from, the identity of the target genes which VGAM669 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[27526] Prion Protein (p27–30) (Creutzfeld–Jakob disease, Gerstmann–Strausler–Scheinker syndrome, fatal familial insomnia) (PRNP, Accession NM\_000311) is a VGAM669 host target gene. PRNP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRNP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRNP BINDING SITE, designated SEQ ID:5849, to the nucleotide sequence of VGAM669 RNA, herein designated VGAM RNA, also designated SEQ ID:3380.

[27527] A function of VGAM669 is therefore inhibition of Prion Protein (p27–30) (Creutzfeld–Jakob disease, Gerstmann–Strausler–Scheinker syndrome, fatal familial insomnia) (PRNP, Accession NM\_000311), a gene which the function of prp is not known. prp is encoded in the host genome and is expressed both in normal and infected cells. Accordingly, utilities of VGAM669 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRNP. The function of PRNP has been established by previous studies. Mutations in the prion protein

gene are associated with Gerstmann–Straussler disease (GSD; 137440), Creutzfeldt–Jakob disease (CJD; 123400), and familial fatal insomnia (OMIM Ref. No. 600072), and aberrant isoforms of the prion protein can act as an infectious agent in these disorders as well as in kuru (OMIM Ref. No. 245300) and in scrapie in sheep. Riek et al. (1998) used the refined NMR structure of the mouse prion protein to investigate the structural basis of inherited human transmissible spongiform encephalopathies. In the cellular form of mouse prion protein, no spatial clustering of mutation sites was observed that would indicate the existence of disease–specific subdomains. A hydrogen bond between residues 128 and 178 provided a structural basis for the observed highly specific influence of a polymorphism at position 129 in human PRNP on the disease phenotype that segregates with the asp178–to–asn (D178N; 176640.0007) mutation. Overall, the NMR structure implied that only some of the disease–related amino acid replacements lead to reduced stability of the cellular form of PRNP, indicating that subtle structural differences in the mutant proteins may affect intermolecular signaling in a variety of different ways. Windl et al. (1999) searched for mutations and polymorphisms in the coding region of

the PRNP gene in 578 patients with suspect prion diseases referred to the German Creutzfeldt–Jakob disease surveillance unit over a period of 4.5 years. They found 40 cases with a missense mutation previously reported as pathogenic. Among these, the D178N mutation was the most common. In all of these cases, D178N was coupled with methionine at codon 129, resulting in the typical fatal familial insomnia genotype. Two novel missense mutations and several silent polymorphisms were found. In their Figure 1, Windl et al. (1999) diagrammed the known pathogenic mutations in the coding region of PRNP. Mead et al. (2001) analyzed the PRNP locus for tightly linked susceptibility factors for prion disease. They identified 56 polymorphic sites within 25 kb of the PRNP open reading frame, including sites within the PRNP promoter and the PRNP 3–prime untranslated region. These were characterized in 61 CEPH families, demonstrating extensive linkage disequilibrium around PRNP and the existence of 11 major European PRNP haplotypes. A common haplotype was overrepresented in patients with sporadic Creutzfeldt–Jakob disease. They could demonstrate that, in addition to the strong susceptibility conferred by codon 129, there was a significant independent association between spo–

radic CJD and a polymorphism upstream of PRNP. Although their sample size was necessarily small, no association was found between these polymorphisms and variant CJD or iatrogenic CJD, in keeping with their having distinct disease mechanisms. Cousens et al. (2001) described a cluster of variant CJD near the Leicestershire village of Queniborough in the U.K. Mead et al. (2001) could find no evidence of a PRNP founder susceptibility effect in that cluster. Animal model experiments lend further support to the function of PRNP. The incubation period and the neuropathology of transmissible spongiform encephalopathies have been extensively used to distinguish prion isolates (or strains) inoculated into panels of inbred mouse strains. Such studies have shown that the bovine spongiform encephalopathy (BSE) agent is indistinguishable from the agent causing variant Creutzfeldt-Jakob disease (vCJD), but differs from isolates of sporadic CJD, reinforcing the idea that the vCJD epidemic in Britain results from consumption of contaminated beef products. Manolakou et al. (2001) presented a mouse model for genetic and environmental factors that modify the incubation period of BSE cross-species transmission. They used 2 mouse strains that carried the same PrP allele, but dis-

played a 100-day difference in their mean incubation period following intracerebral inoculation with primary BSE isolate. They reported genetic effects on incubation period that map to 4 chromosomal regions in the mouse, and in addition they found significant factors of host environment, namely, the age of the host's mother, the age of the host at infection, and an interaction between the X chromosome and the cytoplasm in the host. Miele et al. (2002) identified 3 genes involved in mitochondrial physiology that were differentially expressed in the postnatal developing brains of normal mice and Prnp  $-/-$  mice. Further analysis showed that compared to the hippocampal CA1 regions of Prnp  $+/+$  mice, those of Prnp  $-/-$  mice contained 40% fewer mitochondria, unusual mitochondrial morphology, and significantly increased activity of mitochondrial manganese-dependent antioxidant superoxide dismutase (SOD2; 147460), suggesting greater levels of oxidative assault. These results suggested that there is a relationship between normal cellular PrP expression and quality and quantity of mitochondria.

[27528] It is appreciated that the abovementioned animal model for PRNP is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appre-

ciated from the publications sited hereinbelow.

[27529] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[27530] Miele, G.; Jeffrey, M.; Turnbull, D.; Manson, J.; Clinton, M. : Ablation of cellular prion protein expression affects mitochondrial numbers and morphology. *Biochem. Biophys. Res. Commun.* 291: 372–377, 2002. ; and

[27531] Cousens, J.; Smith, P. G.; Ward, H.; Everington, D.; Knight, R. S. G.; Zeidler, M.; Stewart, G.; Smith–Bathgate, E. A. B.; Macleod, M.–A.; Mackenzie, J.; Will, R. G. : Geographical dis.

[27532] Further studies establishing the function and utilities of PRNP are found in John Hopkins OMIM database record ID 176640, and in cited publications numbered 51–52, 3735, 55–73, 75, 76–78, 3736, 12642–12651, 1655, 12652–12659, 357, 12660–12664, 5469, 5619–5643, 5708, 5712–5718, 5720, 5721–5723, 35 and 5724–5727 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Tripartite Motif-containing 9 (TRIM9, Accession NM\_052978) is another VGAM669 host target gene. TRIM9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TRIM9, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM9 BINDING SITE, designated SEQ ID:27549, to the nucleotide sequence of VGAM669 RNA, herein designated VGAM RNA, also designated SEQ ID:3380.

[27533] Another function of VGAM669 is therefore inhibition of Tripartite Motif-containing 9 (TRIM9, Accession NM\_052978), a gene which may function as a positive regulator for mannosylphosphate transferase and is required to mediate mannosylphosphate transfer in both the core and outer chain portions of n-linked oligosaccharides. Accordingly, utilities of VGAM669 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM9. The function of TRIM9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74.pcnp (Accession NM\_020357) is another VGAM669 host target gene. pcnp BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by pcnp, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Ta-

ble 2 illustrates the complementarity of the nucleotide sequences of pcnp BINDING SITE, designated SEQ ID:21627, to the nucleotide sequence of VGAM669 RNA, herein designated VGAM RNA, also designated SEQ ID:3380.

[27534] Another function of VGAM669 is therefore inhibition of pcnp (Accession NM\_020357). Accordingly, utilities of VGAM669 include diagnosis, prevention and treatment of diseases and clinical conditions associated with pcnp. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 670 (VGAM670) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27535] VGAM670 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM670 was detected is described hereinabove with reference to Figs. 1–8.

[27536] VGAM670 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Yaba-like Disease Virus. VGAM670 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27537] VGAM670 gene encodes a VGAM670 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM670 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM670 precursor RNA is designated SEQ ID:656, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:656 is located at position 116988 relative to the genome of Yaba-like Disease Virus.

[27538] VGAM670 precursor RNA folds onto itself, forming VGAM670 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27539] An enzyme complex designated DICER COMPLEX, `dices` the VGAM670 folded precursor RNA into VGAM670 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM670 RNA is designated SEQ ID:3381, and is provided hereinbelow with reference to the sequence listing part.

[27540] VGAM670 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM670 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM670 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[27541] VGAM670 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM670 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM670 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM670 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM670 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[27542] The complementary binding of VGAM670 RNA, herein designated VGAM RNA, to host target binding sites on VGAM670 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM670 host target RNA into VGAM670 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27543] It is appreciated that VGAM670 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM670 host target genes. The mRNA of each one of this plurality of VGAM670 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM670 RNA, herein designated VGAM RNA, and which when bound by VGAM670 RNA causes inhibition of translation of respective one or more VGAM670 host target proteins.

[27544] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM670 gene, herein designated VGAM GENE, on one or more VGAM670 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,  
`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[27545] It is yet further appreciated that a function of VGAM670 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM670 include diagnosis, prevention and treatment of viral infection by Yaba-like Disease Virus. Specific functions, and accordingly utilities, of VGAM670 correlate with, and may be deduced from, the identity of the host target genes which VGAM670 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27546] Nucleotide sequences of the VGAM670 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM670 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM670 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM670 are further described hereinbelow with reference to Table 1.

[27547] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM670 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM670 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27548] As mentioned hereinabove with reference to Fig. 1, a function of VGAM670 gene, herein designated VGAM is inhibition of expression of VGAM670 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM670 correlate with, and may be deduced from, the identity of the target genes which VGAM670 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27549] Aldo-keto Reductase Family 1, Member D1 (delta 4-3-ketosteroid-5-beta-reductase) (AKR1D1, Accession NM\_005989) is a VGAM670 host target gene. AKR1D1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AKR1D1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKR1D1 BINDING SITE, designated SEQ ID:12610, to the nucleotide sequence of VGAM670 RNA, herein designated VGAM RNA, also designated SEQ

ID:3381.

[27550] A function of VGAM670 is therefore inhibition of Aldo-keto Reductase Family 1, Member D1 (delta 4-3-ketosteroid-5-beta-reductase) (AKR1D1, Accession NM\_005989). Accordingly, utilities of VGAM670 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKR1D1. Reserved (C8orf13, Accession XM\_088377) is another VGAM670 host target gene. C8orf13 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C8orf13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C8orf13 BINDING SITE, designated SEQ ID:39653, to the nucleotide sequence of VGAM670 RNA, herein designated VGAM RNA, also designated SEQ ID:3381.

[27551] Another function of VGAM670 is therefore inhibition of Reserved (C8orf13, Accession XM\_088377). Accordingly, utilities of VGAM670 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C8orf13. CED-6 (Accession NM\_016315) is another VGAM670 host target gene. CED-6 BINDING SITE is HOST

TARGET binding site found in the 3' untranslated region of mRNA encoded by CED-6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CED-6 BINDING SITE, designated SEQ ID:18431, to the nucleotide sequence of VGAM670 RNA, herein designated VGAM RNA, also designated SEQ ID:3381.

[27552] Another function of VGAM670 is therefore inhibition of CED-6 (Accession NM\_016315). Accordingly, utilities of VGAM670 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CED-6. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 671 (VGAM671) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27553] VGAM671 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM671 was detected is described hereinabove with reference to Figs. 1-8.

[27554] VGAM671 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Yaba-like Disease Virus. VGAM671 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27555] VGAM671 gene encodes a VGAM671 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM671 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM671 precursor RNA is designated SEQ ID:657, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:657 is located at position 134323 relative to the genome of Yaba-like Disease Virus.

[27556] VGAM671 precursor RNA folds onto itself, forming VGAM671 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27557] An enzyme complex designated DICER COMPLEX, `dices` the VGAM671 folded precursor RNA into VGAM671 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of VGAM671 RNA is designated SEQ ID:3382, and is provided hereinbelow with reference to the sequence listing part.

[27558] VGAM671 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM671 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM671 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[27559] VGAM671 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM671 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM671 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM671 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM671 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[27560] The complementary binding of VGAM671 RNA, herein designated VGAM RNA, to host target binding sites on VGAM671 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM671 host tar-

get RNA into VGAM671 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27561] It is appreciated that VGAM671 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM671 host target genes. The mRNA of each one of this plurality of VGAM671 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM671 RNA, herein designated VGAM RNA, and which when bound by VGAM671 RNA causes inhibition of translation of respective one or more VGAM671 host target proteins.

[27562] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM671 gene, herein designated VGAM GENE, on one or more VGAM671 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[27563] It is yet further appreciated that a function of VGAM671 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM671 include diagnosis, prevention and treatment of viral infection by Yaba-like Disease Virus. Specific functions, and accordingly utilities, of VGAM671 correlate with, and may be deduced from, the identity of the host target genes which VGAM671 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27564] Nucleotide sequences of the VGAM671 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM671 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM671 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM671 are further

described hereinbelow with reference to Table 1.

[27565] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM671 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM671 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27566] As mentioned hereinabove with reference to Fig. 1, a function of VGAM671 gene, herein designated VGAM is inhibition of expression of VGAM671 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM671 correlate with, and may be deduced from, the identity of the target genes which VGAM671 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27567] Syntaxin 7 (STX7, Accession NM\_003569) is a VGAM671 host target gene. STX7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STX7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STX7 BINDING SITE, designated

SEQ ID:9624, to the nucleotide sequence of VGAM671 RNA, herein designated VGAM RNA, also designated SEQ ID:3382.

[27568] A function of VGAM671 is therefore inhibition of Syntaxin 7 (STX7, Accession NM\_003569). Accordingly, utilities of VGAM671 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STX7. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 672 (VGAM672) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27569] VGAM672 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM672 was detected is described hereinabove with reference to Figs. 1–8.

[27570] VGAM672 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Yaba-like Disease Virus. VGAM672 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27571] VGAM672 gene encodes a VGAM672 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM672 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM672 precursor RNA is designated SEQ ID:658, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:658 is located at position 134123 relative to the genome of Yaba-like Disease Virus.

[27572] VGAM672 precursor RNA folds onto itself, forming VGAM672 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27573] An enzyme complex designated DICER COMPLEX, `dices` the VGAM672 folded precursor RNA into VGAM672 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM672 RNA is designated SEQ ID:3383, and is provided hereinbelow with reference to the sequence listing part.

[27574] VGAM672 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM672 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM672 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[27575] VGAM672 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM672 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM672 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM672 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM672 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[27576] The complementary binding of VGAM672 RNA, herein designated VGAM RNA, to host target binding sites on VGAM672 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM672 host target RNA into VGAM672 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27577] It is appreciated that VGAM672 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM672 host target genes. The mRNA of each one of this plurality of VGAM672 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM672 RNA, herein designated VGAM RNA, and which when bound by VGAM672 RNA causes inhibition of translation of respective one or more VGAM672 host target proteins.

[27578] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM672 gene, herein designated VGAM GENE, on one or more VGAM672 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[27579] It is yet further appreciated that a function of VGAM672 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM672 include diagnosis, prevention and treatment of viral infection by Yaba-like Disease Virus. Specific functions, and accordingly utilities, of VGAM672 correlate with, and may be deduced from, the identity of the host target genes which VGAM672 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27580] Nucleotide sequences of the VGAM672 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM672 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM672 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM672 are further described hereinbelow with reference to Table 1.

[27581] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM672 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM672 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27582] As mentioned hereinabove with reference to Fig. 1, a function of VGAM672 gene, herein designated VGAM is inhibition of expression of VGAM672 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM672 correlate with, and may be deduced from, the identity of the target genes which VGAM672 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27583] SH2 Domain Containing Phosphatase Anchor Protein 1 (SPAP1, Accession NM\_030764) is a VGAM672 host target gene. SPAP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SPAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPAP1 BINDING SITE, designated SEQ ID:25046, to the nucleotide sequence of VGAM672 RNA, herein designated VGAM RNA, also designated SEQ ID:3383.

[27584] A function of VGAM672 is therefore inhibition of SH2 Do-

main Containing Phosphatase Anchor Protein 1 (SPAP1, Accession NM\_030764), a gene which regulation of immunologic function. Accordingly, utilities of VGAM672 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPAP1. The function of SPAP1 has been established by previous studies. Davis et al. (2001) identified 2 BAC clones located at chromosome 1q21.1–q22. They found that one of these clones contained 3 novel putative Ig superfamily genes, which they designated FCRH1 (OMIM Ref. No. 606508), FCRH2, and FCRH3 (OMIM Ref. No. 606510), as well as 2 previously identified members of this family, FCRH4 (IRTA1; 605876) and FCRH5 (IRTA2; 605877). Sequence analysis predicted that the 508–amino acid type I transmembrane protein possesses a hydrophobic signal peptide, 4 extracellular C2 type Ig–like domains, 5 N–linked glycosylation sites, an uncharged transmembrane segment, and an 86–amino acid cytoplasmic tail with 1 ITAM (immunoreceptor tyrosine–based activation motif) and 2 ITIMs. Northern blot analysis revealed expression of approximately 3.0–, 4.4– and 5.5–kb transcripts chiefly in spleen and lymph nodes and a 2.4–kb transcript in kidney. RT–PCR analysis detected expression in mature B–cell lines. Davis et al.

(2001) suggested that FCRH2 may have an activating/inhibitory or a fine-tuning role in regulation of immunologic function

[27585] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[27586] Davis, R. S.; Wang, Y.-H.; Kubagawa, H.; Cooper, M. D. : Identification of a family of Fc receptor homologs with preferential B cell expression. Proc. Nat. Acad. Sci. 98: 9772-9777, 2001. ; and

[27587] Xu, M.; Zhao, R.; Zhao, Z. J. : Molecular cloning and characterization of SPAP1, an inhibitory receptor. Biochem. Biophys. Res. Commun. 280: 768-775, 2001.

[27588] Further studies establishing the function and utilities of SPAP1 are found in John Hopkins OMIM database record ID 606509, and in cited publications numbered 6106-6107 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FENS-1 (Accession NM\_020830) is another VGAM672 host target gene. FENS-1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FENS-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of FENS-1 BINDING SITE, designated SEQ ID:21891, to the nucleotide sequence of VGAM672 RNA, herein designated VGAM RNA, also designated SEQ ID:3383.

[27589] Another function of VGAM672 is therefore inhibition of FENS-1 (Accession NM\_020830). Accordingly, utilities of VGAM672 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FENS-1. FLJ20689 (Accession NM\_017972) is another VGAM672 host target gene. FLJ20689 BINDING SITE1 and FLJ20689 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ20689, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20689 BINDING SITE1 and FLJ20689 BINDING SITE2, designated SEQ ID:19703 and SEQ ID:19599 respectively, to the nucleotide sequence of VGAM672 RNA, herein designated VGAM RNA, also designated SEQ ID:3383.

[27590] Another function of VGAM672 is therefore inhibition of FLJ20689 (Accession NM\_017972). Accordingly, utilities of VGAM672 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FLJ20689. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 674 (VGAM674) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27591] VGAM674 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM674 was detected is described hereinabove with reference to Figs. 1–8.

[27592] VGAM674 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Coronavirus 229E. VGAM674 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27593] VGAM674 gene encodes a VGAM674 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM674 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM674 precursor RNA is designated SEQ ID:660, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:660 is located at position 10541 relative to the genome of Human Coronavirus 229E.

[27594] VGAM674 precursor RNA folds onto itself, forming VGAM674 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27595] An enzyme complex designated DICER COMPLEX, `dices` the VGAM674 folded precursor RNA into VGAM674 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM674 RNA is designated SEQ ID:3385, and is provided hereinbelow with reference to the sequence listing part.

[27596] VGAM674 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM674 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM674 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[27597] VGAM674 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM674 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM674 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM674 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM674 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[27598] The complementary binding of VGAM674 RNA, herein designated VGAM RNA, to host target binding sites on VGAM674 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM674 host target RNA into VGAM674 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27599] It is appreciated that VGAM674 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM674 host target genes. The mRNA of each one of this plurality of VGAM674 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM674 RNA, herein designated VGAM RNA, and which when bound by VGAM674 RNA causes in-

hibition of translation of respective one or more VGAM674 host target proteins.

[27600] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM674 gene, herein designated VGAM GENE, on one or more VGAM674 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[27601] It is yet further appreciated that a function of VGAM674 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM674 include diagnosis, prevention and

treatment of viral infection by Human Coronavirus 229E. Specific functions, and accordingly utilities, of VGAM674 correlate with, and may be deduced from, the identity of the host target genes which VGAM674 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27602] Nucleotide sequences of the VGAM674 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM674 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM674 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM674 are further described hereinbelow with reference to Table 1.

[27603] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM674 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM674 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27604] As mentioned hereinabove with reference to Fig. 1, a function of VGAM674 gene, herein designated VGAM is inhibition of expression of VGAM674 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM674 correlate with, and may be deduced from, the identity of the target genes which VGAM674 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27605] Diacylglycerol Kinase, Beta 90kDa (DGKB, Accession XM\_166516) is a VGAM674 host target gene. DGKB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DGKB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DGKB BINDING SITE, designated SEQ ID:44450, to the nucleotide sequence of VGAM674 RNA, herein designated VGAM RNA, also designated SEQ ID:3385.

[27606] A function of VGAM674 is therefore inhibition of Diacylglycerol Kinase, Beta 90kDa (DGKB, Accession XM\_166516), a gene which regulates the intracellular concentration of the second messenger diacylglycerol (DAG). Accordingly, utilities of VGAM674 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DGKB. The function of DGKB and its association with various diseases and clinical conditions, has

been established by previous studies, as described hereinabove with reference to VGAM497. Hepatocyte Growth Factor (hepapoietin A; scatter factor) (HGF, Accession XM\_168542) is another VGAM674 host target gene. HGF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HGF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HGF BINDING SITE, designated SEQ ID:45226, to the nucleotide sequence of VGAM674 RNA, herein designated VGAM RNA, also designated SEQ ID:3385.

[27607] Another function of VGAM674 is therefore inhibition of Hepatocyte Growth Factor (hepapoietin A; scatter factor) (HGF, Accession XM\_168542), a gene which may be required for normal embryonic development; strongly similar to murine Hgf, has kringle domains. Accordingly, utilities of VGAM674 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HGF. The function of HGF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM174. Zinc Finger Protein 192 (ZNF192, Accession

NM\_006298) is another VGAM674 host target gene. ZNF192 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF192, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF192 BINDING SITE, designated SEQ ID:12991, to the nucleotide sequence of VGAM674 RNA, herein designated VGAM RNA, also designated SEQ ID:3385.

[27608] Another function of VGAM674 is therefore inhibition of Zinc Finger Protein 192 (ZNF192, Accession NM\_006298). Accordingly, utilities of VGAM674 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF192. DKFZP434G1411 (Accession XM\_166383) is another VGAM674 host target gene. DKFZP434G1411 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434G1411, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434G1411 BINDING SITE, designated SEQ ID:44229, to the nucleotide sequence of

VGAM674 RNA, herein designated VGAM RNA, also designated SEQ ID:3385.

[27609] Another function of VGAM674 is therefore inhibition of DKFZP434G1411 (Accession XM\_166383). Accordingly, utilities of VGAM674 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434G1411. DKFZP762D096 (Accession XM\_037662) is another VGAM674 host target gene. DKFZP762D096 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP762D096, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP762D096 BINDING SITE, designated SEQ ID:32664, to the nucleotide sequence of VGAM674 RNA, herein designated VGAM RNA, also designated SEQ ID:3385.

[27610] Another function of VGAM674 is therefore inhibition of DKFZP762D096 (Accession XM\_037662). Accordingly, utilities of VGAM674 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP762D096. N4BP3 (Accession XM\_038920) is another VGAM674 host target gene. N4BP3 BINDING SITE

is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by N4BP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of N4BP3 BINDING SITE, designated SEQ ID:32943, to the nucleotide sequence of VGAM674 RNA, herein designated VGAM RNA, also designated SEQ ID:3385.

[27611] Another function of VGAM674 is therefore inhibition of N4BP3 (Accession XM\_038920). Accordingly, utilities of VGAM674 include diagnosis, prevention and treatment of diseases and clinical conditions associated with N4BP3. LOC134637 (Accession XM\_059727) is another VGAM674 host target gene. LOC134637 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC134637, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC134637 BINDING SITE, designated SEQ ID:37079, to the nucleotide sequence of VGAM674 RNA, herein designated VGAM RNA, also designated SEQ ID:3385.

[27612] Another function of VGAM674 is therefore inhibition of

LOC134637 (Accession XM\_059727). Accordingly, utilities of VGAM674 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC134637. LOC147622 (Accession XM\_097255) is another VGAM674 host target gene. LOC147622 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147622, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147622 BINDING SITE, designated SEQ ID:40850, to the nucleotide sequence of VGAM674 RNA, herein designated VGAM RNA, also designated SEQ ID:3385.

[27613] Another function of VGAM674 is therefore inhibition of LOC147622 (Accession XM\_097255). Accordingly, utilities of VGAM674 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147622. LOC151361 (Accession XM\_098048) is another VGAM674 host target gene. LOC151361 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151361, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC151361 BINDING SITE, designated SEQ ID:41332, to the nucleotide sequence of VGAM674 RNA, herein designated VGAM RNA, also designated SEQ ID:3385.

[27614] Another function of VGAM674 is therefore inhibition of LOC151361 (Accession XM\_098048). Accordingly, utilities of VGAM674 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151361. LOC152263 (Accession XM\_098195) is another VGAM674 host target gene. LOC152263 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152263, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152263 BINDING SITE, designated SEQ ID:41483, to the nucleotide sequence of VGAM674 RNA, herein designated VGAM RNA, also designated SEQ ID:3385.

[27615] Another function of VGAM674 is therefore inhibition of LOC152263 (Accession XM\_098195). Accordingly, utilities of VGAM674 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152263. LOC51580 (Accession NM\_015874) is an-

other VGAM674 host target gene. LOC51580 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51580, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51580 BINDING SITE, designated SEQ ID:18018, to the nucleotide sequence of VGAM674 RNA, herein designated VGAM RNA, also designated SEQ ID:3385.

[27616] Another function of VGAM674 is therefore inhibition of LOC51580 (Accession NM\_015874). Accordingly, utilities of VGAM674 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51580. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 675 (VGAM675) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27617] VGAM675 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM675 was detected is described

hereinabove with reference to Figs. 1–8.

[27618] VGAM675 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Coronavirus 229E. VGAM675 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27619] VGAM675 gene encodes a VGAM675 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM675 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM675 precursor RNA is designated SEQ ID:661, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:661 is located at position 12342 relative to the genome of Human Coronavirus 229E.

[27620] VGAM675 precursor RNA folds onto itself, forming VGAM675 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed–reversed sequence of the nucleotide sequence of the second half thereof.

[27621] An enzyme complex designated DICER COMPLEX, `dices` the VGAM675 folded precursor RNA into VGAM675 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM675 RNA is designated SEQ ID:3386, and is provided hereinbelow with reference to the sequence listing part.

[27622] VGAM675 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM675 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM675 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[27623] VGAM675 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM675 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM675 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM675 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM675 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[27624] The complementary binding of VGAM675 RNA, herein designated VGAM RNA, to host target binding sites on VGAM675 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM675 host target RNA into VGAM675 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27625] It is appreciated that VGAM675 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM675 host target genes. The mRNA of each one of this plurality of VGAM675 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM675 RNA, herein designated VGAM RNA, and which when bound by VGAM675 RNA causes inhibition of translation of respective one or more VGAM675 host target proteins.

[27626] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM675 gene, herein designated VGAM GENE, on one or more VGAM675 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[27627] It is yet further appreciated that a function of VGAM675 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM675 include diagnosis, prevention and treatment of viral infection by Human Coronavirus 229E. Specific functions, and accordingly utilities, of VGAM675 correlate with, and may be deduced from, the identity of the host target genes which VGAM675 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27628] Nucleotide sequences of the VGAM675 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM675 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM675 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM675 are further described hereinbelow with reference to Table 1.

[27629] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM675 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM675 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27630] As mentioned hereinabove with reference to Fig. 1, a function of VGAM675 gene, herein designated VGAM is inhibition of expression of VGAM675 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM675 correlate with, and may be deduced from, the identity of the target genes which VGAM675 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27631] A Disintegrin and Metalloproteinase Domain 12 (meltrin alpha) (ADAM12, Accession NM\_003474) is a VGAM675 host target gene. ADAM12 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADAM12, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAM12 BINDING SITE, designated SEQ ID:9543, to the nucleotide sequence of VGAM675 RNA, herein designated VGAM RNA, also designated SEQ ID:3386.

[27632] A function of VGAM675 is therefore inhibition of A Disintegrin and Metalloproteinase Domain 12 (meltrin alpha) (ADAM12, Accession NM\_003474), a gene which involved in skeletal muscle regeneration, specifically at the onset of cell fusion. Accordingly, utilities of VGAM675 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAM12. The function of ADAM12 has been established by previous studies. To isolate genes related to fertilin expressed in muscle, Yagami-Hiromasa et al. (1995) amplified cDNAs prepared from a mouse myogenic cell line by PCR using degenerative primers for conserved amino acids between fertilin-alpha and -beta (OMIM Ref. No. 601533). They identified 3 novel mouse sequences, which they called meltrins. Similarly to myogenin, a marker of early muscle differentiation, mouse meltrin-alpha is expressed in neonatal muscle and bone, and its expression increases dramatically in

response to the induction of differentiation. Immunocytochemical localization and functional expression studies suggested that meltrin- $\alpha$  may be involved in myotube formation. Galliano et al. (2000) found by RT-PCR and immunoblot analyses that expression of mouse Adam12 increases during muscle regeneration, while the levels of other ADAMs remain constant. Immunofluorescence analysis revealed staining of small, newly formed muscle fibers in regenerating but not normal adult muscle cells. Using a yeast 2-hybrid screen of a human skeletal muscle cDNA library with the cytoplasmic tail of human ADAM12 as bait, Galliano et al. (2000) determined that the membrane proximal portion of the C-terminal half of myristoylated ADAM12 interacts with muscle-specific  $\alpha$ -actinin-2 (ACTN2; 102573). Galliano et al. (2000) determined that overexpression of cytosolic ADAM12 containing the ACTN2-binding site inhibits mouse myoblast fusion.

[27633] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[27634] Galliano, M.-F.; Huet, C.; Frygeliuss, J.; Polgren, A.; Wewer, U. M.; Engvall, E. : Binding of ADAM12, a marker of skele-

tal muscle regeneration, to the muscle-specific actin-binding protein, alpha-actinin-2, is required for myoblast fusion. J. Biol. Chem. 275: 13933-13939, 2000. ; and

[27635] Yagami-Hiromasa, T.; Sato, T.; Kurisaki, T.; Kamijo, K.; Nabeshima, Y.; Fujisawa-Sehara, A. : A metalloprotease-disintegrin participating in myoblast fusion. Nature 377: 652-656, 1995.

[27636] Further studies establishing the function and utilities of ADAM12 are found in John Hopkins OMIM database record ID 602714, and in cited publications numbered 1124-1126 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Arachidonate 12-lipoxygenase, 12R Type (ALOX12B, Accession NM\_001139) is another VGAM675 host target gene. ALOX12B BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ALOX12B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALOX12B BINDING SITE, designated SEQ ID:6807, to the nucleotide sequence of VGAM675 RNA, herein designated VGAM RNA, also designated SEQ ID:3386.

[27637] Another function of VGAM675 is therefore inhibition of Arachidonate 12-lipoxygenase, 12R Type (ALOX12B, Accession NM\_001139), a gene which converts arachidonic acid to 12r- hydroperoxyeicosatetraenoic acid (12r-hpETE). Accordingly, utilities of VGAM675 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALOX12B. The function of ALOX12B has been established by previous studies. 12R-lipoxygenase catalyzes the conversion of arachidonic acid to 12R-hydroxyeicosatetraenoic acid (12R-HETE). In a database search for novel lipoxygenases, Sun et al. (1998) identified a novel lipoxygenase gene. The cDNA encoded a 701-amino acid polypeptide which when expressed produced a protein with specific 12R-lipoxygenase activity. By RT-PCR, but not by Northern blot analysis, Sun et al. (1998) detected 12R-lipoxygenase mRNA in B cells and adult skin. Boeglin et al. (1998) also cloned the ALOX12B gene. The ALOX12B cDNA showed the greatest sequence similarity to the second type of human 15S-lipoxygenase (ALOX15B; 603697), and was more distantly related to human 12S-lipoxygenase (ALOX12; 152391). They showed that ALOX12B is expressed in keratinocytes and psoriatic scales, but they were not able to detect any tran-

scription of the gene on several multiple-tissue Northern blots. Boeglin et al. (1998) provided mechanistic evidence for a lipoxygenase route to 12R-HETE in human psoriatic tissue and described a 12R-lipoxygenase that could account for the biosynthesis.

[27638] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[27639] Boeglin, W. E.; Kim, R. B.; Brash, A. R. : A 12R-lipoxygenase in human skin: mechanistic evidence, molecular cloning, and expression. Proc. Nat. Acad. Sci. 95: 6744-6749, 1998. ; and

[27640] Jobard, F.; Lefevre, C.; Karaduman, A.; Blanchet-Bardon, C.; Emre, S.; Weissenbach, J.; Ozguc, M.; Lathrop, M.; Prud'homme, J.-F.; Fischer, J. : Lipoxygenase-3 (ALOXE3) and 12(R)-lipoxy.

[27641] Further studies establishing the function and utilities of ALOX12B are found in John Hopkins OMIM database record ID 603741, and in cited publications numbered 289 and 9437 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. ASH1 (Accession NM\_018489) is another VGAM675 host target gene. ASH1 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by ASH1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ASH1 BINDING SITE, designated SEQ ID:20548, to the nucleotide sequence of VGAM675 RNA, herein designated VGAM RNA, also designated SEQ ID:3386.

[27642] Another function of VGAM675 is therefore inhibition of ASH1 (Accession NM\_018489), a gene which is a candidate regulator of development in the mammalian central nervous system and neural crest. Accordingly, utilities of VGAM675 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ASH1. The function of ASH1 has been established by previous studies. Using retroviral labeling in organotypic slice cultures of the embryonic human forebrain, Letinic et al. (2002) demonstrated the existence of 2 distinct lineages of neocortical GABAergic neurons. One lineage expresses DLX1 (OMIM Ref. No. 600029) and DLX2 (OMIM Ref. No. 126255) and MASH1 transcription factors, represents 65% of neocortical GABAergic neurons in humans, and originates from MASH1-expressing progenitors of the neocor-

tical ventricular and subventricular zone of the dorsal forebrain. The second lineage, characterized by the expression of DLX1 and DLX2 but not MASH1, forms around 35% of the GABAergic neurons and originates from the ganglionic eminence of the ventral forebrain. Letinic et al. (2002) suggested that modifications in the expression pattern of transcription factors in the forebrain may underlie species-specific programs for the generation of neocortical local circuit neurons and that distinct lineages of cortical interneurons may be differentially affected in genetic and acquired diseases of the human brain. Animal model experiments lend further support to the function of MASH1. By homologous recombination in embryonic stem cells, Guillemot et al. (1993) created a null allele of the Mash1 gene. Homozygous mice died at birth with apparent breathing and feeding defects. The brain and spinal cord appeared normal, but the olfactory epithelium and sympathetic, parasympathetic, and enteric ganglia were severely affected. These observations suggested that the Mash1 gene, like its *Drosophila* homologs, controls a basic operation in development of neuronal progenitors in distinct neural lineages.

[27643] It is appreciated that the abovementioned animal model

for ASH1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[27644] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[27645] Letinic, K.; Zoncu, R.; Rakic, P. : Origin of GABAergic neurons in the human neocortex. *Nature* 417: 645–649, 2002. ; and

[27646] Guillemot, F.; Lo, L.-C.; Johnson, J. E.; Auerbach, A.; Anderson, D. J.; Joyner, A. L. : Mammalian achaete-scute homolog 1 is required for the early development of olfactory and autonom.

[27647] Further studies establishing the function and utilities of ASH1 are found in John Hopkins OMIM database record ID 100790, and in cited publications numbered 12331–1233 and 12762 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. ATP Synthase, H<sup>+</sup> Transporting, Mitochondrial F<sub>0</sub> Complex, Subunit F6 (ATP5J, Accession NM\_001685) is another VGAM675 host target gene. ATP5J BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ATP5J, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP5J BINDING SITE, designated SEQ ID:7408, to the nucleotide sequence of VGAM675 RNA, herein designated VGAM RNA, also designated SEQ ID:3386.

[27648] Another function of VGAM675 is therefore inhibition of ATP Synthase, H<sup>+</sup> Transporting, Mitochondrial F0 Complex, Subunit F6 (ATP5J, Accession NM\_001685), a gene which is one of the chains of the nonenzymatic component of the mitochondrial ATPase complex. Accordingly, utilities of VGAM675 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP5J. The function of ATP5J and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM556.DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide, Y Chromosome (DBY, Accession NM\_004660) is another VGAM675 host target gene. DBY BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DBY, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of DBY BINDING SITE, designated SEQ ID:11026, to the nucleotide sequence of VGAM675 RNA, herein designated VGAM RNA, also designated SEQ ID:3386.

[27649] Another function of VGAM675 is therefore inhibition of DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide, Y Chromosome (DBY, Accession NM\_004660), a gene which plays a key role in the spermatogenic process. Accordingly, utilities of VGAM675 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DBY. The function of DBY and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM374. Hexokinase 1 (HK1, Accession NM\_033497) is another VGAM675 host target gene. HK1 BINDING SITE1 through HK1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by HK1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HK1 BINDING SITE1 through HK1 BINDING SITE3, designated SEQ ID:27269, SEQ ID:27272 and SEQ ID:27275 respectively, to the nu-

cleotide sequence of VGAM675 RNA, herein designated VGAM RNA, also designated SEQ ID:3386.

[27650] Another function of VGAM675 is therefore inhibition of Hexokinase 1 (HK1, Accession NM\_033497). Accordingly, utilities of VGAM675 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HK1. KiSS-1 Metastasis-suppressor (KISS1, Accession NM\_002256) is another VGAM675 host target gene. KISS1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KISS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KISS1 BINDING SITE, designated SEQ ID:8061, to the nucleotide sequence of VGAM675 RNA, herein designated VGAM RNA, also designated SEQ ID:3386.

[27651] Another function of VGAM675 is therefore inhibition of KiSS-1 Metastasis-suppressor (KISS1, Accession NM\_002256), a gene which suppresses metastases of melanomas and breast carcinomas without affecting tumorigenicity. Accordingly, utilities of VGAM675 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KISS1. The function of KISS1

has been established by previous studies. Welch et al. (1994) found that microcell-mediated transfer of human chromosome 6 into human metastatic melanoma cells (C8161 or MelJuSo) suppressed their ability to metastasize in athymic nude mice by at least 95% without affecting the tumorigenicity of the cells. Using a modified subtractive hybridization approach, Lee et al. (1996) isolated a cDNA expressed in hybrid chromosome 6-C8161 cells but not in parental C8161 cells. They designated the cDNA KISS1, combining laboratory nomenclature for putative suppressor sequences with acknowledgment of the gene's discovery in Hershey, Pennsylvania. Lee et al. (1996) reported the sequence of the predicted KISS1 protein and a corrected sequence in a published erratum. The KISS1 protein consists of 145 amino acids. Northern blot analysis revealed that KISS1 was expressed as a 1-kb mRNA in chromosome 6-C8161 hybrid cell lines as well as in normal placenta tissue. Low levels of smaller transcripts were observed in pancreas and kidney. Lee et al. (1996) did not detect KISS1 expression in any cell line capable of metastasizing in athymic nude mice.

[27652] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [27653] Lee, J.-H.; Welch, D. R. : Suppression of metastasis in human breast carcinoma MDA-MB-435 cells after transfection with the metastasis suppressor gene, KiSS-1. *Cancer Res.* 57: 2384-2387, 1997. ; and
- [27654] Ohtaki, T.; Shintani, Y.; Honda, S.; Matsumoto, H.; Hori, A.; Kanehashi, K.; Terao, Y.; Kumano, S.; Takatsu, Y.; Masuda, Y.; Ishibashi, Y.; Watanabe, T.; and 9 others : Metastasis suppr.
- [27655] Further studies establishing the function and utilities of KISS1 are found in John Hopkins OMIM database record ID 603286, and in cited publications numbered 5276-5280 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Outer Dense Fiber of Sperm Tails 2 (ODF2, Accession NM\_002540) is another VGAM675 host target gene. ODF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ODF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ODF2 BINDING SITE, designated SEQ ID:8387, to the nucleotide sequence of VGAM675 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:3386.

[27656] Another function of VGAM675 is therefore inhibition of Outer Dense Fiber of Sperm Tails 2 (ODF2, Accession NM\_002540), a gene which is very strongly similar to rat Odf2 . Accordingly, utilities of VGAM675 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ODF2. The function of ODF2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM363. Pyrimidinergic Receptor P2Y, G-protein Coupled, 6 (P2RY6, Accession NM\_004154) is another VGAM675 host target gene. P2RY6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by P2RY6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P2RY6 BINDING SITE, designated SEQ ID:10354, to the nucleotide sequence of VGAM675 RNA, herein designated VGAM RNA, also designated SEQ ID:3386.

[27657] Another function of VGAM675 is therefore inhibition of Pyrimidinergic Receptor P2Y, G-protein Coupled, 6

(P2RY6, Accession NM\_004154), a gene which mediates cellular responses to nucleotides. Accordingly, utilities of VGAM675 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P2RY6. The function of P2RY6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM445. Protein Phosphatase 2 (formerly 2A), Regulatory Subunit B (PR 52), Beta Isoform (PPP2R2B, Accession NM\_004576) is another VGAM675 host target gene. PPP2R2B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP2R2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP2R2B BINDING SITE, designated SEQ ID:10922, to the nucleotide sequence of VGAM675 RNA, herein designated VGAM RNA, also designated SEQ ID:3386.

[27658] Another function of VGAM675 is therefore inhibition of Protein Phosphatase 2 (formerly 2A), Regulatory Subunit B (PR 52), Beta Isoform (PPP2R2B, Accession NM\_004576). Accordingly, utilities of VGAM675 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with PPP2R2B. Protein Phosphatase 2, Regulatory Subunit B (B56), Alpha Isoform (PPP2R5A, Accession NM\_006243) is another VGAM675 host target gene.

PPP2R5A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP2R5A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP2R5A BINDING SITE, designated SEQ ID:12908, to the nucleotide sequence of VGAM675 RNA, herein designated VGAM RNA, also designated SEQ ID:3386.

[27659] Another function of VGAM675 is therefore inhibition of Protein Phosphatase 2, Regulatory Subunit B (B56), Alpha Isoform (PPP2R5A, Accession NM\_006243), a gene which is a regulatory subunit of protein phosphatase 2A. Accordingly, utilities of VGAM675 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP2R5A. The function of PPP2R5A has been established by previous studies. Protein phosphorylation is a regulatory mechanism commonly employed in cellular processes such as cell cycle progression, growth factor

signaling, and cell transformation. Protein phosphatase 2A (PP2A), a heterotrimeric serine/threonine phosphatase, has been implicated in a variety of regulatory processes including cell growth and division, muscle contraction, and gene transcription. PP2A is a trimeric enzyme composed of a catalytic subunit (OMIM Ref. No. 176915), a structural subunit, and any of several different regulatory subunits which control its specificity. One family of related PP2A regulatory subunits is designated the B56 family and contains at least 5 different members (McCright and Virshup (1995)). The alpha subunit gene encodes a cytoplasmic phosphoprotein. The alpha and gamma (OMIM Ref. No. 601645) subunits are expressed at highest levels in skeletal and cardiac muscle. See also the entries describing the beta (OMIM Ref. No. 601644), delta (OMIM Ref. No. 601646), and epsilon (OMIM Ref. No. 601647) subunits. McCright et al. (1996) mapped the gene for the alpha subunit, designated PPP2R5A, to 1q41 by fluorescence in situ hybridization.

[27660] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[27661] McCright, B.; Brothman, A. R.; Virshup, D. M. : Assignment

of human protein phosphatase 2A regulatory subunit genes B56-alpha, B56-beta, B56-gamma, B56-delta, and B56-epsilon (PPP2R5A--PPP2R5E), highly expressed in muscle and brain, to chromosome regions 1q41, 11q12, 3p21, 6p21.1, and 7p11.2-to-p12. Genomics 36: 168-170, 1996. ; and

[27662] McCright, B.; Virshup, D. M. : Identification of a new family of protein phosphatase 2A regulatory subunits. J. Biol. Chem. 270: 26123-26128, 1995.

[27663] Further studies establishing the function and utilities of PPP2R5A are found in John Hopkins OMIM database record ID 601643, and in cited publications numbered 6687-6688 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. SNL (Accession NM\_003088) is another VGAM675 host target gene. SNL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SNL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNL BINDING SITE, designated SEQ ID:9066, to the nucleotide sequence of VGAM675 RNA, herein designated VGAM RNA, also designated SEQ ID:3386.

[27664] Another function of VGAM675 is therefore inhibition of SNL (Accession NM\_003088), a gene which organizes filamentous actin into bundles with a minimum of 4.1:1 actin/fascin ratio. Accordingly, utilities of VGAM675 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNL. The function of SNL has been established by previous studies. Sea urchin fascin, one of the first actin-bundling proteins extensively characterized, can crosslink actin filaments in vitro (Bryan and Kane, 1982). The cloning of a fascin cDNA by Bryan et al. (1993) showed that fascin is homologous to the *Drosophila* singed gene product. Duh et al. (1994) isolated cDNAs encoding the human homolog of sea urchin fascin and *Drosophila* singed, called HSN by them, from a human teratocarcinoma cDNA library. The HSN mRNA was expressed at various levels in all human tissues analyzed, and it was highly expressed in actively growing renal carcinoma cell lines and in activated but not in resting lymphocytes, suggesting a functional role for HSN in proliferation. The HSN gene is predicted to encode a 493-amino acid protein with a molecular mass of 55 kD. Based on peptide sequence identity and immunocrossreactivity, Duh et al. (1994) indicated that the HSN protein is the 55-kD

actin-bundling protein purified from HeLa cells (Yamashiro-Matsumura and Matsumura, 1985). This HeLa cell-derived 55-kD protein is thought to be involved in the assembly of actin filament bundles present in microspikes, membrane ruffles, and stress fibers (Yamashiro-Matsumura and Matsumura, 1986). Using immunohistochemistry, Pinkus et al. (1997) found that nearly all Reed-Sternberg cells in Hodgkin disease (OMIM Ref. No. 236000), except in the nodular lymphocyte predominance type, express fascin. They proposed that fascin expression may be helpful in distinguishing Hodgkin from non-Hodgkin lymphoma and suggested that Reed-Sternberg cells may have a dendritic cell derivation.

[27665] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[27666] Pinkus, G. S.; Pinkus, J. L.; Langhoff, E.; Matsumura, F.; Yamashiro, S.; Mosialos, G.; Said, J. W. : Fascin, a sensitive new marker for Reed-Sternberg cells of Hodgkin's disease: evidence for a dendritic or B cell derivation? *Am. J. Path.* 150: 543-562, 1997. ; and

[27667] Sonderbye, L.; Magerstadt, R.; Blatman, R. N.; Preffer, F. I.;

Langhoff, E. : Selective expression of human fascin (p55) by dendritic leukocytes. Adv. Exp. Med. Biol. 471: 41–46, 1997.

[27668] Further studies establishing the function and utilities of SNL are found in John Hopkins OMIM database record ID 602689, and in cited publications numbered 544 and 7640–7647 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. TEM7 (Accession NM\_020405) is another VGAM675 host target gene. TEM7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TEM7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TEM7 BINDING SITE, designated SEQ ID:21669, to the nucleotide sequence of VGAM675 RNA, herein designated VGAM RNA, also designated SEQ ID:3386.

[27669] Another function of VGAM675 is therefore inhibition of TEM7 (Accession NM\_020405), a gene which involves in angiogenesis. Accordingly, utilities of VGAM675 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TEM7. The function of TEM7 and its association with various diseases and clinical

conditions, has been established by previous studies, as described hereinabove with reference to VGAM23.F-box Only Protein 27 (FBXO27, Accession XM\_059045) is another VGAM675 host target gene. FBXO27 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FBXO27, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBXO27 BINDING SITE, designated SEQ ID:36838, to the nucleotide sequence of VGAM675 RNA, herein designated VGAM RNA, also designated SEQ ID:3386.

[27670] Another function of VGAM675 is therefore inhibition of F-box Only Protein 27 (FBXO27, Accession XM\_059045). Accordingly, utilities of VGAM675 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXO27. FLJ10521 (Accession NM\_018125) is another VGAM675 host target gene. FLJ10521 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10521, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

FLJ10521 BINDING SITE, designated SEQ ID:19911, to the nucleotide sequence of VGAM675 RNA, herein designated VGAM RNA, also designated SEQ ID:3386.

[27671] Another function of VGAM675 is therefore inhibition of FLJ10521 (Accession NM\_018125). Accordingly, utilities of VGAM675 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10521. Hepatitis B Virus X Associated Protein (HBXAP, Accession NM\_016578) is another VGAM675 host target gene. HBXAP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HBXAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HBXAP BINDING SITE, designated SEQ ID:18656, to the nucleotide sequence of VGAM675 RNA, herein designated VGAM RNA, also designated SEQ ID:3386.

[27672] Another function of VGAM675 is therefore inhibition of Hepatitis B Virus X Associated Protein (HBXAP, Accession NM\_016578). Accordingly, utilities of VGAM675 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HBXAP. Histamine Receptor

H4 (HRH4, Accession NM\_021624) is another VGAM675 host target gene. HRH4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HRH4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HRH4 BINDING SITE, designated SEQ ID:22257, to the nucleotide sequence of VGAM675 RNA, herein designated VGAM RNA, also designated SEQ ID:3386.

[27673] Another function of VGAM675 is therefore inhibition of Histamine Receptor H4 (HRH4, Accession NM\_021624). Accordingly, utilities of VGAM675 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HRH4. KIAA0089 (Accession XM\_046056) is another VGAM675 host target gene. KIAA0089 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0089, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0089 BINDING SITE, designated SEQ ID:34666, to the nucleotide sequence of VGAM675 RNA, herein designated

VGAM RNA, also designated SEQ ID:3386.

[27674] Another function of VGAM675 is therefore inhibition of KIAA0089 (Accession XM\_046056). Accordingly, utilities of VGAM675 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0089. KIAA0547 (Accession NM\_014793) is another VGAM675 host target gene. KIAA0547 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0547, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0547 BINDING SITE, designated SEQ ID:16695, to the nucleotide sequence of VGAM675 RNA, herein designated VGAM RNA, also designated SEQ ID:3386.

[27675] Another function of VGAM675 is therefore inhibition of KIAA0547 (Accession NM\_014793). Accordingly, utilities of VGAM675 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0547. KIAA1318 (Accession XM\_041080) is another VGAM675 host target gene. KIAA1318 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1318, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1318 BINDING SITE, designated SEQ ID:33429, to the nucleotide sequence of VGAM675 RNA, herein designated VGAM RNA, also designated SEQ ID:3386.

[27676] Another function of VGAM675 is therefore inhibition of KIAA1318 (Accession XM\_041080). Accordingly, utilities of VGAM675 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1318. MGC16175 (Accession NM\_032765) is another VGAM675 host target gene. MGC16175 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC16175, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC16175 BINDING SITE, designated SEQ ID:26511, to the nucleotide sequence of VGAM675 RNA, herein designated VGAM RNA, also designated SEQ ID:3386.

[27677] Another function of VGAM675 is therefore inhibition of MGC16175 (Accession NM\_032765). Accordingly, utilities of VGAM675 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with MGC16175. PRO1866 (Accession NM\_018510) is another VGAM675 host target gene. PRO1866 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRO1866, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1866 BINDING SITE, designated SEQ ID:20580, to the nucleotide sequence of VGAM675 RNA, herein designated VGAM RNA, also designated SEQ ID:3386.

[27678] Another function of VGAM675 is therefore inhibition of PRO1866 (Accession NM\_018510). Accordingly, utilities of VGAM675 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1866. Williams Beuren Syndrome Chromosome Region 22 (WBSCR22, Accession NM\_017528) is another VGAM675 host target gene. WBSCR22 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by WBSCR22, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WBSCR22 BINDING SITE,

designated SEQ ID:18971, to the nucleotide sequence of VGAM675 RNA, herein designated VGAM RNA, also designated SEQ ID:3386.

[27679] Another function of VGAM675 is therefore inhibition of Williams Beuren Syndrome Chromosome Region 22 (WBSCR22, Accession NM\_017528). Accordingly, utilities of VGAM675 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WBSCR22. Zinc Finger Protein 230 (ZNF230, Accession NM\_006300) is another VGAM675 host target gene. ZNF230 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ZNF230, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF230 BINDING SITE, designated SEQ ID:12994, to the nucleotide sequence of VGAM675 RNA, herein designated VGAM RNA, also designated SEQ ID:3386.

[27680] Another function of VGAM675 is therefore inhibition of Zinc Finger Protein 230 (ZNF230, Accession NM\_006300). Accordingly, utilities of VGAM675 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with ZNF230. LOC145989 (Accession XM\_004815) is another VGAM675 host target gene. LOC145989 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145989, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145989 BINDING SITE, designated SEQ ID:29954, to the nucleotide sequence of VGAM675 RNA, herein designated VGAM RNA, also designated SEQ ID:3386.

[27681] Another function of VGAM675 is therefore inhibition of LOC145989 (Accession XM\_004815). Accordingly, utilities of VGAM675 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145989. LOC148018 (Accession XM\_092020) is another VGAM675 host target gene. LOC148018 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148018, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148018 BINDING SITE, designated SEQ ID:40090, to

the nucleotide sequence of VGAM675 RNA, herein designated VGAM RNA, also designated SEQ ID:3386.

[27682] Another function of VGAM675 is therefore inhibition of LOC148018 (Accession XM\_092020). Accordingly, utilities of VGAM675 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148018. LOC148223 (Accession XM\_086101) is another VGAM675 host target gene. LOC148223 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148223, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148223 BINDING SITE, designated SEQ ID:38494, to the nucleotide sequence of VGAM675 RNA, herein designated VGAM RNA, also designated SEQ ID:3386.

[27683] Another function of VGAM675 is therefore inhibition of LOC148223 (Accession XM\_086101). Accordingly, utilities of VGAM675 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148223. LOC158401 (Accession XM\_088568) is another VGAM675 host target gene. LOC158401 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC158401, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158401 BINDING SITE, designated SEQ ID:39836, to the nucleotide sequence of VGAM675 RNA, herein designated VGAM RNA, also designated SEQ ID:3386.

[27684] Another function of VGAM675 is therefore inhibition of LOC158401 (Accession XM\_088568). Accordingly, utilities of VGAM675 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158401. LOC203378 (Accession XM\_117541) is another VGAM675 host target gene. LOC203378 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203378, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203378 BINDING SITE, designated SEQ ID:43549, to the nucleotide sequence of VGAM675 RNA, herein designated VGAM RNA, also designated SEQ ID:3386.

[27685] Another function of VGAM675 is therefore inhibition of LOC203378 (Accession XM\_117541). Accordingly, utilities

of VGAM675 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203378. LOC220549 (Accession XM\_167521) is another VGAM675 host target gene. LOC220549 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC220549, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220549 BINDING SITE, designated SEQ ID:44648, to the nucleotide sequence of VGAM675 RNA, herein designated VGAM RNA, also designated SEQ ID:3386.

[27686] Another function of VGAM675 is therefore inhibition of LOC220549 (Accession XM\_167521). Accordingly, utilities of VGAM675 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220549. LOC221490 (Accession XM\_168084) is another VGAM675 host target gene. LOC221490 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC221490, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC221490 BINDING SITE, designated SEQ ID:44985, to the nucleotide sequence of VGAM675 RNA, herein designated VGAM RNA, also designated SEQ ID:3386.

[27687] Another function of VGAM675 is therefore inhibition of LOC221490 (Accession XM\_168084). Accordingly, utilities of VGAM675 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221490. LOC255146 (Accession XM\_170985) is another VGAM675 host target gene. LOC255146 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255146, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255146 BINDING SITE, designated SEQ ID:45755, to the nucleotide sequence of VGAM675 RNA, herein designated VGAM RNA, also designated SEQ ID:3386.

[27688] Another function of VGAM675 is therefore inhibition of LOC255146 (Accession XM\_170985). Accordingly, utilities of VGAM675 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255146. LOC255452 (Accession XM\_174088) is another VGAM675 host target gene. LOC255452 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC255452, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255452 BINDING SITE, designated SEQ ID:46576, to the nucleotide sequence of VGAM675 RNA, herein designated VGAM RNA, also designated SEQ ID:3386.

[27689] Another function of VGAM675 is therefore inhibition of LOC255452 (Accession XM\_174088). Accordingly, utilities of VGAM675 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255452. LOC257000 (Accession XM\_172999) is another VGAM675 host target gene. LOC257000 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC257000, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257000 BINDING SITE, designated SEQ ID:46271, to the nucleotide sequence of VGAM675 RNA, herein designated VGAM RNA, also designated SEQ ID:3386.

[27690] Another function of VGAM675 is therefore inhibition of

LOC257000 (Accession XM\_172999). Accordingly, utilities of VGAM675 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257000. LOC90785 (Accession XM\_034110) is another VGAM675 host target gene. LOC90785 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90785, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90785 BINDING SITE, designated SEQ ID:32005, to the nucleotide sequence of VGAM675 RNA, herein designated VGAM RNA, also designated SEQ ID:3386.

[27691] Another function of VGAM675 is therefore inhibition of LOC90785 (Accession XM\_034110). Accordingly, utilities of VGAM675 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90785. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 676 (VGAM676) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is

known in the art.

[27692] VGAM676 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM676 was detected is described hereinabove with reference to Figs. 1–8.

[27693] VGAM676 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Coronavirus 229E. VGAM676 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27694] VGAM676 gene encodes a VGAM676 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM676 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM676 precursor RNA is designated SEQ ID:662, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:662 is located at position 13267 relative to the genome of Human Coronavirus 229E.

[27695] VGAM676 precursor RNA folds onto itself, forming VGAM676 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional

`hairpin structure`. As is well known in the art, this  
`hairpin structure`, is typical of RNA encoded by miRNA  
genes, and is due to the fact that the nucleotide sequence  
of the first half of the RNA encoded by a miRNA gene is an  
accurate or partial inversed-reversed sequence of the nu-  
cleotide sequence of the second half thereof.

[27696] An enzyme complex designated DICER COMPLEX, `dices`  
the VGAM676 folded precursor RNA into VGAM676 RNA,  
herein designated VGAM RNA, a single stranded ~22 nt  
long RNA segment. As is known in the art, `dicing` of a  
hairpin structured RNA precursor product into a short  
~22nt RNA segment is catalyzed by an enzyme complex  
comprising an enzyme called Dicer together with other  
necessary proteins. A probable (over 48%) nucleotide se-  
quence of VGAM676 RNA is designated SEQ ID:3387, and  
is provided hereinbelow with reference to the sequence  
listing part.

[27697] VGAM676 host target gene, herein designated VGAM  
HOST TARGET GENE, encodes a corresponding messenger  
RNA, VGAM676 host target RNA, herein designated VGAM  
HOST TARGET RNA. VGAM676 host target RNA comprises  
three regions, as is typical of mRNA of a protein coding  
gene: a 5` untranslated region, a protein coding region

and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[27698] VGAM676 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM676 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM676 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM676 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM676 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[27699] The complementary binding of VGAM676 RNA, herein designated VGAM RNA, to host target binding sites on VGAM676 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM676 host target RNA into VGAM676 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27700] It is appreciated that VGAM676 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM676 host target genes. The mRNA of each one of this plurality of VGAM676 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM676 RNA, herein designated VGAM RNA, and which when bound by VGAM676 RNA causes inhibition of translation of respective one or more VGAM676 host target proteins.

[27701] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM676 gene, herein designated VGAM GENE, on one or

more VGAM676 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[27702] It is yet further appreciated that a function of VGAM676 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM676 include diagnosis, prevention and treatment of viral infection by Human Coronavirus 229E. Specific functions, and accordingly utilities, of VGAM676 correlate with, and may be deduced from, the identity of the host target genes which VGAM676 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [27703] Nucleotide sequences of the VGAM676 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM676 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM676 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM676 are further described hereinbelow with reference to Table 1.
- [27704] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM676 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM676 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [27705] As mentioned hereinabove with reference to Fig. 1, a function of VGAM676 gene, herein designated VGAM is inhibition of expression of VGAM676 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM676 correlate with, and may be deduced from, the identity of the target genes which VGAM676 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.
- [27706] Fatty-acid-Coenzyme A Ligase, Long-chain 5 (FACL5, Ac-

cession XM\_034424) is a VGAM676 host target gene. FACL5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FACL5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FACL5 BINDING SITE, designated SEQ ID:32105, to the nucleotide sequence of VGAM676 RNA, herein designated VGAM RNA, also designated SEQ ID:3387.

[27707] A function of VGAM676 is therefore inhibition of Fatty-acid-Coenzyme A Ligase, Long-chain 5 (FACL5, Accession XM\_034424), a gene which may be involved in fatty acid metabolism; contains an AMP-binding domain. Accordingly, utilities of VGAM676 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FACL5. The function of FACL5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM357. Frizzled Homolog 10 (Drosophila) (FZD10, Accession NM\_007197) is another VGAM676 host target gene. FZD10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region

of mRNA encoded by FZD10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FZD10 BINDING SITE, designated SEQ ID:14049, to the nucleotide sequence of VGAM676 RNA, herein designated VGAM RNA, also designated SEQ ID:3387.

[27708] Another function of VGAM676 is therefore inhibition of Frizzled Homolog 10 (Drosophila) (FZD10, Accession NM\_007197). Accordingly, utilities of VGAM676 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FZD10. Transforming, Acidic Coiled-coil Containing Protein 1 (TACC1, Accession NM\_006283) is another VGAM676 host target gene. TACC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TACC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TACC1 BINDING SITE, designated SEQ ID:12959, to the nucleotide sequence of VGAM676 RNA, herein designated VGAM RNA, also designated SEQ ID:3387.

[27709] Another function of VGAM676 is therefore inhibition of Transforming, Acidic Coiled-coil Containing Protein 1 (TACC1, Accession NM\_006283). Accordingly, utilities of VGAM676 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TACC1. Wolf-Hirschhorn Syndrome Candidate 1 (WHSC1, Accession NM\_133333) is another VGAM676 host target gene. WHSC1 BINDING SITE1 through WHSC1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by WHSC1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WHSC1 BINDING SITE1 through WHSC1 BINDING SITE3, designated SEQ ID:28457, SEQ ID:28472 and SEQ ID:28440 respectively, to the nucleotide sequence of VGAM676 RNA, herein designated VGAM RNA, also designated SEQ ID:3387.

[27710] Another function of VGAM676 is therefore inhibition of Wolf-Hirschhorn Syndrome Candidate 1 (WHSC1, Accession NM\_133333), a gene which binds covalently to and repairs g/t mismatches. Accordingly, utilities of VGAM676 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WHSC1. The func-

tion of WHSC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200.DEPP (Accession NM\_007021) is another VGAM676 host target gene. DEPP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DEPP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DEPP BINDING SITE, designated SEQ ID:13876, to the nucleotide sequence of VGAM676 RNA, herein designated VGAM RNA, also designated SEQ ID:3387.

[27711] Another function of VGAM676 is therefore inhibition of DEPP (Accession NM\_007021). Accordingly, utilities of VGAM676 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DEPP. DKFZP761I2123 (Accession NM\_031449) is another VGAM676 host target gene. DKFZP761I2123 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP761I2123, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates

the complementarity of the nucleotide sequences of DKFZP761I2123 BINDING SITE, designated SEQ ID:25462, to the nucleotide sequence of VGAM676 RNA, herein designated VGAM RNA, also designated SEQ ID:3387.

[27712] Another function of VGAM676 is therefore inhibition of DKFZP761I2123 (Accession NM\_031449). Accordingly, utilities of VGAM676 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP761I2123. FLJ14768 (Accession NM\_032836) is another VGAM676 host target gene. FLJ14768 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14768, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14768 BINDING SITE, designated SEQ ID:26616, to the nucleotide sequence of VGAM676 RNA, herein designated VGAM RNA, also designated SEQ ID:3387.

[27713] Another function of VGAM676 is therefore inhibition of FLJ14768 (Accession NM\_032836). Accordingly, utilities of VGAM676 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14768. GMPPB (Accession XM\_171044) is another VGAM676 host

target gene. GMPPB BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by GMPPB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GMPPB BINDING SITE, designated SEQ ID:45815, to the nucleotide sequence of VGAM676 RNA, herein designated VGAM RNA, also designated SEQ ID:3387.

[27714] Another function of VGAM676 is therefore inhibition of GMPPB (Accession XM\_171044). Accordingly, utilities of VGAM676 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GMPPB. KIAA0335 (Accession NM\_014803) is another VGAM676 host target gene. KIAA0335 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0335, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0335 BINDING SITE, designated SEQ ID:16730, to the nucleotide sequence of VGAM676 RNA, herein designated VGAM RNA, also designated SEQ ID:3387.

[27715] Another function of VGAM676 is therefore inhibition of KIAA0335 (Accession NM\_014803). Accordingly, utilities of VGAM676 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0335. KIAA1553 (Accession XM\_166320) is another VGAM676 host target gene. KIAA1553 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1553, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1553 BINDING SITE, designated SEQ ID:44141, to the nucleotide sequence of VGAM676 RNA, herein designated VGAM RNA, also designated SEQ ID:3387.

[27716] Another function of VGAM676 is therefore inhibition of KIAA1553 (Accession XM\_166320). Accordingly, utilities of VGAM676 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1553. Rpo1-2 (Accession NM\_019014) is another VGAM676 host target gene. Rpo1-2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by Rpo1-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Rpo1-2 BINDING SITE, designated SEQ ID:21101, to the nucleotide sequence of VGAM676 RNA, herein designated VGAM RNA, also designated SEQ ID:3387.

[27717] Another function of VGAM676 is therefore inhibition of Rpo1-2 (Accession NM\_019014). Accordingly, utilities of VGAM676 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Rpo1-2. Solute Carrier Family 17 (sodium-dependent inorganic phosphate cotransporter), Member 6 (SLC17A6, Accession NM\_020346) is another VGAM676 host target gene. SLC17A6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC17A6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC17A6 BINDING SITE, designated SEQ ID:21593, to the nucleotide sequence of VGAM676 RNA, herein designated VGAM RNA, also designated SEQ ID:3387.

[27718] Another function of VGAM676 is therefore inhibition of Solute Carrier Family 17 (sodium-dependent inorganic

phosphate cotransporter), Member 6 (SLC17A6, Accession NM\_020346). Accordingly, utilities of VGAM676 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC17A6. LOC143392 (Accession XM\_096423) is another VGAM676 host target gene. LOC143392 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC143392, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143392 BINDING SITE, designated SEQ ID:40357, to the nucleotide sequence of VGAM676 RNA, herein designated VGAM RNA, also designated SEQ ID:3387.

[27719] Another function of VGAM676 is therefore inhibition of LOC143392 (Accession XM\_096423). Accordingly, utilities of VGAM676 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143392. LOC148189 (Accession XM\_086087) is another VGAM676 host target gene. LOC148189 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148189, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148189 BINDING SITE, designated SEQ ID:38482, to the nucleotide sequence of VGAM676 RNA, herein designated VGAM RNA, also designated SEQ ID:3387.

[27720] Another function of VGAM676 is therefore inhibition of LOC148189 (Accession XM\_086087). Accordingly, utilities of VGAM676 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148189. LOC149271 (Accession XM\_086475) is another VGAM676 host target gene. LOC149271 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149271, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149271 BINDING SITE, designated SEQ ID:38678, to the nucleotide sequence of VGAM676 RNA, herein designated VGAM RNA, also designated SEQ ID:3387.

[27721] Another function of VGAM676 is therefore inhibition of LOC149271 (Accession XM\_086475). Accordingly, utilities of VGAM676 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC149271. LOC157623 (Accession XM\_088346) is another VGAM676 host target gene. LOC157623 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157623, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157623 BINDING SITE, designated SEQ ID:39617, to the nucleotide sequence of VGAM676 RNA, herein designated VGAM RNA, also designated SEQ ID:3387.

[27722] Another function of VGAM676 is therefore inhibition of LOC157623 (Accession XM\_088346). Accordingly, utilities of VGAM676 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157623. LOC203197 (Accession XM\_114645) is another VGAM676 host target gene. LOC203197 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203197, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203197 BINDING SITE, designated SEQ ID:43010, to the nucleotide sequence of VGAM676 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3387.

[27723] Another function of VGAM676 is therefore inhibition of LOC203197 (Accession XM\_114645). Accordingly, utilities of VGAM676 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203197. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 677 (VGAM677) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27724] VGAM677 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM677 was detected is described hereinabove with reference to Figs. 1–8.

[27725] VGAM677 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Coronavirus 229E. VGAM677 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27726] VGAM677 gene encodes a VGAM677 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM677 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM677 precursor RNA is designated SEQ ID:663, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:663 is located at position 4047 relative to the genome of Human Coronavirus 229E.

[27727] VGAM677 precursor RNA folds onto itself, forming VGAM677 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27728] An enzyme complex designated DICER COMPLEX, `dices` the VGAM677 folded precursor RNA into VGAM677 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM677 RNA is designated SEQ ID:3388, and is provided hereinbelow with reference to the sequence listing part.

[27729] VGAM677 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM677 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM677 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[27730] VGAM677 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM677 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM677 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM677 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM677 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[27731] The complementary binding of VGAM677 RNA, herein designated VGAM RNA, to host target binding sites on VGAM677 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM677 host target RNA into VGAM677 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27732] It is appreciated that VGAM677 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM677 host target genes. The mRNA of

each one of this plurality of VGAM677 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM677 RNA, herein designated VGAM RNA, and which when bound by VGAM677 RNA causes inhibition of translation of respective one or more VGAM677 host target proteins.

[27733] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM677 gene, herein designated VGAM GENE, on one or more VGAM677 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[27734] It is yet further appreciated that a function of VGAM677 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM677 include diagnosis, prevention and treatment of viral infection by Human Coronavirus 229E. Specific functions, and accordingly utilities, of VGAM677 correlate with, and may be deduced from, the identity of the host target genes which VGAM677 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27735] Nucleotide sequences of the VGAM677 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM677 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM677 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM677 are further described hereinbelow with reference to Table 1.

[27736] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM677 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM677 RNA, herein desig-

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[27737] As mentioned hereinabove with reference to Fig. 1, a function of VGAM677 gene, herein designated VGAM is inhibition of expression of VGAM677 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM677 correlate with, and may be deduced from, the identity of the target genes which VGAM677 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27738] Adducin 1 (alpha) (ADD1, Accession NM\_014189) is a VGAM677 host target gene. ADD1 BINDING SITE1 and ADD1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ADD1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADD1 BINDING SITE1 and ADD1 BINDING SITE2, designated SEQ ID:15469 and SEQ ID:15473 respectively, to the nucleotide sequence of VGAM677 RNA, herein designated VGAM RNA, also designated SEQ ID:3388.

[27739] A function of VGAM677 is therefore inhibition of Adducin

1 (alpha) (ADD1, Accession NM\_014189), a gene which membrane-cytoskeleton- protein that promotes the assembly of the spectrin-actin network. Accordingly, utilities of VGAM677 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADD1. The function of ADD1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM474. FXYD Domain Containing Ion Transport Regulator 6 (FXYD6, Accession NM\_022003) is another VGAM677 host target gene. FXYD6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FXYD6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FXYD6 BINDING SITE, designated SEQ ID:22551, to the nucleotide sequence of VGAM677 RNA, herein designated VGAM RNA, also designated SEQ ID:3388.

[27740] Another function of VGAM677 is therefore inhibition of FXYD Domain Containing Ion Transport Regulator 6 (FXYD6, Accession NM\_022003). Accordingly, utilities of VGAM677 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FXVD6. Hepatocyte Growth Factor (hepatopoietin A; scatter factor) (HGF, Accession XM\_168542) is another VGAM677 host target gene. HGF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HGF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HGF BINDING SITE, designated SEQ ID:45229, to the nucleotide sequence of VGAM677 RNA, herein designated VGAM RNA, also designated SEQ ID:3388.

[27741] Another function of VGAM677 is therefore inhibition of Hepatocyte Growth Factor (hepatopoietin A; scatter factor) (HGF, Accession XM\_168542), a gene which may be required for normal embryonic development; strongly similar to murine Hgf, has kringle domains. Accordingly, utilities of VGAM677 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HGF. The function of HGF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM174. Transient Receptor Potential Cation Channel,

Subfamily V, Member 1 (TRPV1, Accession NM\_080706) is another VGAM677 host target gene. TRPV1 BINDING SITE1 through TRPV1 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TRPV1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPV1 BINDING SITE1 through TRPV1 BINDING SITE4, designated SEQ ID:28011, SEQ ID:27995, SEQ ID:28003 and SEQ ID:20815 respectively, to the nucleotide sequence of VGAM677 RNA, herein designated VGAM RNA, also designated SEQ ID:3388.

[27742] Another function of VGAM677 is therefore inhibition of Transient Receptor Potential Cation Channel, Subfamily V, Member 1 (TRPV1, Accession NM\_080706), a gene which functions as a receptor for capsaicin. Accordingly, utilities of VGAM677 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPV1. The function of TRPV1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM146.KIAA0240 (Accession XM\_166479) is another VGAM677 host target gene. KIAA0240 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0240, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0240 BINDING SITE, designated SEQ ID:44407, to the nucleotide sequence of VGAM677 RNA, herein designated VGAM RNA, also designated SEQ ID:3388.

[27743] Another function of VGAM677 is therefore inhibition of KIAA0240 (Accession XM\_166479). Accordingly, utilities of VGAM677 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0240. Phosphodiesterase 11A (PDE11A, Accession NM\_016953) is another VGAM677 host target gene. PDE11A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PDE11A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDE11A BINDING SITE, designated SEQ ID:18868, to the nucleotide sequence of VGAM677 RNA, herein designated VGAM RNA, also designated SEQ ID:3388.

[27744] Another function of VGAM677 is therefore inhibition of Phosphodiesterase 11A (PDE11A, Accession NM\_016953). Accordingly, utilities of VGAM677 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE11A. LOC146268 (Accession XM\_085397) is another VGAM677 host target gene. LOC146268 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146268, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146268 BINDING SITE, designated SEQ ID:38125, to the nucleotide sequence of VGAM677 RNA, herein designated VGAM RNA, also designated SEQ ID:3388.

[27745] Another function of VGAM677 is therefore inhibition of LOC146268 (Accession XM\_085397). Accordingly, utilities of VGAM677 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146268. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 678 (VGAM678) viral gene, which modu-

lates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27746] VGAM678 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM678 was detected is described hereinabove with reference to Figs. 1–8.

[27747] VGAM678 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Coronavirus 229E. VGAM678 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27748] VGAM678 gene encodes a VGAM678 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM678 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM678 precursor RNA is designated SEQ ID:664, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:664 is located at position 16921 relative to the genome of Human Coronavirus 229E.

[27749] VGAM678 precursor RNA folds onto itself, forming

VGAM678 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27750] An enzyme complex designated DICER COMPLEX, `dices` the VGAM678 folded precursor RNA into VGAM678 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM678 RNA is designated SEQ ID:3389, and is provided hereinbelow with reference to the sequence listing part.

[27751] VGAM678 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM678 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM678 host target RNA comprises

three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[27752] VGAM678 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM678 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM678 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM678 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM678 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[27753] The complementary binding of VGAM678 RNA, herein designated VGAM RNA, to host target binding sites on VGAM678 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM678 host target RNA into VGAM678 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27754] It is appreciated that VGAM678 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM678 host target genes. The mRNA of each one of this plurality of VGAM678 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM678 RNA, herein designated VGAM RNA, and which when bound by VGAM678 RNA causes inhibition of translation of respective one or more VGAM678 host target proteins.

[27755] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM678 gene, herein designated VGAM GENE, on one or more VGAM678 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[27756] It is yet further appreciated that a function of VGAM678 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM678 include diagnosis, prevention and treatment of viral infection by Human Coronavirus 229E. Specific functions, and accordingly utilities, of VGAM678 correlate with, and may be deduced from, the identity of the host target genes which VGAM678 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[27757] Nucleotide sequences of the VGAM678 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM678 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM678 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM678 are further described hereinbelow with reference to Table 1.

[27758] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM678 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM678 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27759] As mentioned hereinabove with reference to Fig. 1, a function of VGAM678 gene, herein designated VGAM is inhibition of expression of VGAM678 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM678 correlate with, and may be deduced from, the identity of the target genes which VGAM678 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[27760] Fibroblast Growth Factor 7 (keratinocyte growth factor) (FGF7, Accession NM\_002009) is a VGAM678 host target gene. FGF7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FGF7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGF7 BINDING SITE, designated SEQ ID:7747, to the nucleotide sequence of VGAM678 RNA, herein designated VGAM RNA, also designated SEQ ID:3389.

[27761] A function of VGAM678 is therefore inhibition of Fibroblast Growth Factor 7 (keratinocyte growth factor) (FGF7, Accession NM\_002009), a gene which growth factor active on keratinocytes. Accordingly, utilities of VGAM678 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGF7. The function of FGF7 has been established by previous studies. Rubin et al. (1989) identified a growth factor specific for epithelial cells in conditioned medium of a human embryonic lung fibroblast cell line. Because of its predominant activity in keratinocytes, it was referred to as keratinocyte growth factor. KGF was found to consist of a single polypeptide

chain of about 28 kD. It was a potent mitogen for epithelial cells but lacked mitogenic activity on either fibroblasts or endothelial cells. Microsequencing showed an amino-terminal sequence containing no significant homology to any known protein. The release of this growth factor by human embryonic fibroblasts raised the possibility that KGF may play a role in mesenchymal stimulation of normal epithelial cell proliferation. In an addendum, Rubin et al. (1989) noted that by use of all the nucleotide probes based on the N-terminal sequence reported in their paper, they had isolated clones encoding KGF and had found significant structural homology between KGF and the other 5 known members of the fibroblast growth factor (FGF) family. Werner et al. (1994) assessed the function of KGF in normal and wounded skin by expression of a dominant-negative KGF receptor (OMIM Ref. No. 176943) in basal keratinocytes. The skin of transgenic mice was characterized by epidermal atrophy, abnormalities in the hair follicles, and dermal hyperthickening. Upon skin injury, inhibition of KGF receptor signaling reduced the proliferation rate of epidermal keratinocytes at the wound edge, resulting in substantially delayed reepithelialization of the wound. Using a cosmid probe encoding KGF exon 1 for

fluorescence in situ hybridization, Zimonjic et al. (1997) assigned the KGF7 gene to 15q15–q21.1. In addition, copies of KGF–like sequences hybridizing only with a cos–mid probe encoding exons 2 and 3 were localized to dispersed sites on chromosome 2q21, 9p11, 9q12–q13, 18p11, 18q11, 21q11, and 21q21.1. The distribution of KGF–like sequences suggested a role for alphoid DNA in their amplification and dispersion. In chimpanzee, KGF–like sequences were observed at 5 chromosomal sites, which were each homologous to sites in human, while in gorilla a subset of 4 of these homologous sites was identified. In orangutan 2 sites were identified, while gibbon exhibited only a single site. The chromosomal localization of KGF sequences in human and great ape genomes indicated that amplification and dispersion occurred in multiple discrete steps, with initial KGF gene duplication and dispersion occurring in multiple discrete steps, with initial KGF gene duplication and dispersion taking place in gibbon and involving loci corresponding to human chromosomes 15 and 21. The findings of Zimonjic et al. (1997) supported the concept of a closer evolutionary relationship of human with chimpanzee and with primates and a possible selective pressure for KGF dispersion during the

evolution of higher primates.

[27762] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[27763] Rubin, J. S.; Osada, H.; Finch, P. W.; Taylor, W. G.; Rudikoff, S.; Aaronson, S. A. : Purification and characterization of a newly identified growth factor specific for epithelial cells. Proc. Nat. Acad. Sci. 86: 802–806, 1989. ; and

[27764] Werner, S.; Smola, H.; Liao, X.; Longaker, M. T.; Krieg, T.; Hofschneider, P. H.; Williams, L. T. : The function of KGF in morphogenesis of epithelium and reepithelialization of wounds.

[27765] Further studies establishing the function and utilities of FGF7 are found in John Hopkins OMIM database record ID 148180, and in cited publications numbered 11377–11381 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Integrin, Alpha 1 (ITGA1, Accession XM\_032902) is another VGAM678 host target gene. ITGA1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ITGA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND–

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGA1 BINDING SITE, designated SEQ ID:31792, to the nucleotide sequence of VGAM678 RNA, herein designated VGAM RNA, also designated SEQ ID:3389.

[27766] Another function of VGAM678 is therefore inhibition of Integrin, Alpha 1 (ITGA1, Accession XM\_032902). Accordingly, utilities of VGAM678 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGA1. Chromosome 20 Open Reading Frame 64 (C20orf64, Accession NM\_033550) is another VGAM678 host target gene. C20orf64 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf64, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf64 BINDING SITE, designated SEQ ID:27309, to the nucleotide sequence of VGAM678 RNA, herein designated VGAM RNA, also designated SEQ ID:3389.

[27767] Another function of VGAM678 is therefore inhibition of Chromosome 20 Open Reading Frame 64 (C20orf64, Accession NM\_033550). Accordingly, utilities of VGAM678

include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf64. Sialyltransferase 8D (alpha-2, 8-polysialyltransferase) (SIAT8D, Accession NM\_005668) is another VGAM678 host target gene. SIAT8D BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SIAT8D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIAT8D BINDING SITE, designated SEQ ID:12222, to the nucleotide sequence of VGAM678 RNA, herein designated VGAM RNA, also designated SEQ ID:3389.

[27768] Another function of VGAM678 is therefore inhibition of Sialyltransferase 8D (alpha-2, 8-polysialyltransferase) (SIAT8D, Accession NM\_005668). Accordingly, utilities of VGAM678 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIAT8D. SNIP1 (Accession NM\_024700) is another VGAM678 host target gene. SNIP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SNIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of SNIP1 BINDING SITE, designated SEQ ID:24010, to the nucleotide sequence of VGAM678 RNA, herein designated VGAM RNA, also designated SEQ ID:3389.

[27769] Another function of VGAM678 is therefore inhibition of SNIP1 (Accession NM\_024700). Accordingly, utilities of VGAM678 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNIP1. LOC120448 (Accession XM\_062032) is another VGAM678 host target gene. LOC120448 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC120448, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC120448 BINDING SITE, designated SEQ ID:37221, to the nucleotide sequence of VGAM678 RNA, herein designated VGAM RNA, also designated SEQ ID:3389.

[27770] Another function of VGAM678 is therefore inhibition of LOC120448 (Accession XM\_062032). Accordingly, utilities of VGAM678 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC120448. LOC145216 (Accession XM\_096730) is another VGAM678 host target gene. LOC145216 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145216, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145216 BINDING SITE, designated SEQ ID:40504, to the nucleotide sequence of VGAM678 RNA, herein designated VGAM RNA, also designated SEQ ID:3389.

[27771] Another function of VGAM678 is therefore inhibition of LOC145216 (Accession XM\_096730). Accordingly, utilities of VGAM678 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145216. LOC154743 (Accession XM\_088029) is another VGAM678 host target gene. LOC154743 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC154743, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154743 BINDING SITE, designated SEQ ID:39481, to the nucleotide sequence of VGAM678 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3389.

[27772] Another function of VGAM678 is therefore inhibition of LOC154743 (Accession XM\_088029). Accordingly, utilities of VGAM678 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154743. LOC196812 (Accession XM\_116868) is another VGAM678 host target gene. LOC196812 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196812, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196812 BINDING SITE, designated SEQ ID:43134, to the nucleotide sequence of VGAM678 RNA, herein designated VGAM RNA, also designated SEQ ID:3389.

[27773] Another function of VGAM678 is therefore inhibition of LOC196812 (Accession XM\_116868). Accordingly, utilities of VGAM678 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196812. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 679 (VGAM679) viral gene, which modu-

lates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27774] VGAM679 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM679 was detected is described hereinabove with reference to Figs. 1–8.

[27775] VGAM679 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Coronavirus 229E. VGAM679 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27776] VGAM679 gene encodes a VGAM679 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM679 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM679 precursor RNA is designated SEQ ID:665, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:665 is located at position 1569 relative to the genome of Human Coronavirus 229E.

[27777] VGAM679 precursor RNA folds onto itself, forming

VGAM679 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27778] An enzyme complex designated DICER COMPLEX, `dices` the VGAM679 folded precursor RNA into VGAM679 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM679 RNA is designated SEQ ID:3390, and is provided hereinbelow with reference to the sequence listing part.

[27779] VGAM679 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM679 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM679 host target RNA comprises

three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[27780] VGAM679 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM679 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM679 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM679 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM679 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[27781] The complementary binding of VGAM679 RNA, herein designated VGAM RNA, to host target binding sites on VGAM679 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM679 host target RNA into VGAM679 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27782] It is appreciated that VGAM679 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM679 host target genes. The mRNA of each one of this plurality of VGAM679 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM679 RNA, herein designated VGAM RNA, and which when bound by VGAM679 RNA causes inhibition of translation of respective one or more VGAM679 host target proteins.

[27783] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM679 gene, herein designated VGAM GENE, on one or more VGAM679 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[27784] It is yet further appreciated that a function of VGAM679 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM679 include diagnosis, prevention and treatment of viral infection by Human Coronavirus 229E. Specific functions, and accordingly utilities, of VGAM679 correlate with, and may be deduced from, the identity of the host target genes which VGAM679 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[27785] Nucleotide sequences of the VGAM679 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM679 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM679 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM679 are further described hereinbelow with reference to Table 1.

[27786] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM679 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM679 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27787] As mentioned hereinabove with reference to Fig. 1, a function of VGAM679 gene, herein designated VGAM is inhibition of expression of VGAM679 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM679 correlate with, and may be deduced from, the identity of the target genes which VGAM679 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[27788] V-abl Abelson Murine Leukemia Viral Oncogene Homolog 1 (ABL1, Accession NM\_005157) is a VGAM679 host target gene. ABL1 BINDING SITE1 and ABL1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ABL1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABL1 BINDING SITE1 and ABL1 BINDING SITE2, designated SEQ ID:11635 and SEQ ID:14224 respectively, to the nucleotide sequence of VGAM679 RNA, herein designated VGAM RNA, also designated SEQ ID:3390.

[27789] A function of VGAM679 is therefore inhibition of V-abl Abelson Murine Leukemia Viral Oncogene Homolog 1 (ABL1, Accession NM\_005157). Accordingly, utilities of VGAM679 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABL1. Parkinson Disease (autosomal recessive, juvenile) 2, Parkin (PARK2, Accession NM\_013988) is another VGAM679 host target gene. PARK2 BINDING SITE1 through PARK2 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PARK2, corre-

sponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PARK2 BINDING SITE1 through PARK2 BINDING SITE3, designated SEQ ID:15155, SEQ ID:10901 and SEQ ID:15148 respectively, to the nucleotide sequence of VGAM679 RNA, herein designated VGAM RNA, also designated SEQ ID:3390.

[27790] Another function of VGAM679 is therefore inhibition of Parkinson Disease (autosomal recessive, juvenile) 2, Parkin (PARK2, Accession NM\_013988). Accordingly, utilities of VGAM679 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PARK2. SAC2 Suppressor of Actin Mutations 2-like (yeast) (SACM2L, Accession NM\_080564) is another VGAM679 host target gene. SACM2L BINDING SITE1 and SACM2L BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SACM2L, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SACM2L BINDING SITE1 and SACM2L BINDING SITE2, designated SEQ ID:27885 and SEQ ID:21841 respectively, to

the nucleotide sequence of VGAM679 RNA, herein designated VGAM RNA, also designated SEQ ID:3390.

[27791] Another function of VGAM679 is therefore inhibition of SAC2 Suppressor of Actin Mutations 2-like (yeast) (SACM2L, Accession NM\_080564). Accordingly, utilities of VGAM679 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SACM2L. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 680 (VGAM680) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27792] VGAM680 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM680 was detected is described hereinabove with reference to Figs. 1–8.

[27793] VGAM680 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Coronavirus 229E. VGAM680 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27794] VGAM680 gene encodes a VGAM680 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM680 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM680 precursor RNA is designated SEQ ID:666, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:666 is located at position 14292 relative to the genome of Human Coronavirus 229E.

[27795] VGAM680 precursor RNA folds onto itself, forming VGAM680 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27796] An enzyme complex designated DICER COMPLEX, `dices` the VGAM680 folded precursor RNA into VGAM680 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM680 RNA is designated SEQ ID:3391, and is provided hereinbelow with reference to the sequence listing part.

[27797] VGAM680 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM680 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM680 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[27798] VGAM680 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM680 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM680 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM680 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM680 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[27799] The complementary binding of VGAM680 RNA, herein designated VGAM RNA, to host target binding sites on VGAM680 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM680 host target RNA into VGAM680 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27800] It is appreciated that VGAM680 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM680 host target genes. The mRNA of each one of this plurality of VGAM680 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM680 RNA, herein designated VGAM RNA, and which when bound by VGAM680 RNA causes inhibition of translation of respective one or more VGAM680 host target proteins.

[27801] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM680 gene, herein designated VGAM GENE, on one or more VGAM680 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[27802] It is yet further appreciated that a function of VGAM680 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM680 include diagnosis, prevention and treatment of viral infection by Human Coronavirus 229E. Specific functions, and accordingly utilities, of VGAM680 correlate with, and may be deduced from, the identity of the host target genes which VGAM680 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27803] Nucleotide sequences of the VGAM680 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM680 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM680 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM680 are further described hereinbelow with reference to Table 1.

[27804] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM680 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM680 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27805] As mentioned hereinabove with reference to Fig. 1, a function of VGAM680 gene, herein designated VGAM is inhibition of expression of VGAM680 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM680 correlate with, and may be deduced from, the identity of the target genes which VGAM680 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27806] ATPase, H<sup>+</sup> Transporting, Lysosomal 13kDa, V1 Subunit G Isoform 2 (ATP6V1G2, Accession NM\_130463) is a VGAM680 host target gene. ATP6V1G2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ATP6V1G2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP6V1G2 BINDING SITE, designated SEQ ID:28224, to the nucleotide sequence of VGAM680 RNA, herein designated VGAM RNA, also designated SEQ ID:3391.

[27807] A function of VGAM680 is therefore inhibition of ATPase,

H<sup>+</sup> Transporting, Lysosomal 13kDa, V1 Subunit G Isoform 2 (ATP6V1G2, Accession NM\_130463). Accordingly, utilities of VGAM680 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP6V1G2. Inositol 1,4,5-triphosphate Receptor, Type 2 (ITPR2, Accession NM\_002223) is another VGAM680 host target gene. ITPR2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITPR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITPR2 BINDING SITE, designated SEQ ID:7988, to the nucleotide sequence of VGAM680 RNA, herein designated VGAM RNA, also designated SEQ ID:3391.

[27808] Another function of VGAM680 is therefore inhibition of Inositol 1,4,5-triphosphate Receptor, Type 2 (ITPR2, Accession NM\_002223). Accordingly, utilities of VGAM680 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITPR2. PSA (Accession NM\_021154) is another VGAM680 host target gene. PSA BINDING SITE1 and PSA BINDING SITE2 are HOST TARGET binding sites found in untranslated regions

of mRNA encoded by PSA, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSA BINDING SITE1 and PSA BINDING SITE2, designated SEQ ID:22128 and SEQ ID:27737 respectively, to the nucleotide sequence of VGAM680 RNA, herein designated VGAM RNA, also designated SEQ ID:3391.

[27809] Another function of VGAM680 is therefore inhibition of PSA (Accession NM\_021154), a gene which is puromycin-sensitive aminopeptidase and has metallopeptidase activity. Accordingly, utilities of VGAM680 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSA. The function of PSA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM65.LOC146455 (Accession XM\_085471) is another VGAM680 host target gene.

LOC146455 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146455, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of LOC146455 BINDING SITE, designated SEQ ID:38155, to the nucleotide sequence of VGAM680 RNA, herein designated VGAM RNA, also designated SEQ ID:3391.

[27810] Another function of VGAM680 is therefore inhibition of LOC146455 (Accession XM\_085471). Accordingly, utilities of VGAM680 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146455. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 681 (VGAM681) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27811] VGAM681 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM681 was detected is described hereinabove with reference to Figs. 1–8.

[27812] VGAM681 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Coronavirus 229E. VGAM681 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in

the human genome.

[27813] VGAM681 gene encodes a VGAM681 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM681 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM681 precursor RNA is designated SEQ ID:667, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:667 is located at position 9140 relative to the genome of Human Coronavirus 229E.

[27814] VGAM681 precursor RNA folds onto itself, forming VGAM681 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27815] An enzyme complex designated DICER COMPLEX, `dices` the VGAM681 folded precursor RNA into VGAM681 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM681 RNA is designated SEQ ID:3392, and is provided hereinbelow with reference to the sequence listing part.

[27816] VGAM681 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM681 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM681 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[27817] VGAM681 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM681 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM681 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM681 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM681 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[27818] The complementary binding of VGAM681 RNA, herein designated VGAM RNA, to host target binding sites on VGAM681 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM681 host target RNA into VGAM681 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27819] It is appreciated that VGAM681 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM681 host target genes. The mRNA of each one of this plurality of VGAM681 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM681 RNA, herein designated VGAM RNA, and which when bound by VGAM681 RNA causes inhibition of translation of respective one or more VGAM681 host target proteins.

[27820] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM681 gene, herein designated VGAM GENE, on one or more VGAM681 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[27821] It is yet further appreciated that a function of VGAM681 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM681 include diagnosis, prevention and treatment of viral infection by Human Coronavirus 229E. Specific functions, and accordingly utilities, of VGAM681 correlate with, and may be deduced from, the identity of the host target genes which VGAM681 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27822] Nucleotide sequences of the VGAM681 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM681 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM681 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM681 are further described hereinbelow with reference to Table 1.

[27823] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM681 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM681 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27824] As mentioned hereinabove with reference to Fig. 1, a function of VGAM681 gene, herein designated VGAM is inhibition of expression of VGAM681 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM681 correlate with, and may be deduced from, the identity of the target genes which VGAM681 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27825] NKX3A (Accession NM\_006167) is a VGAM681 host target gene. NKX3A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NKX3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NKX3A BINDING SITE, designated SEQ ID:12830, to the nucleotide sequence of VGAM681 RNA, herein designated VGAM RNA, also designated SEQ ID:3392.

[27826] A function of VGAM681 is therefore inhibition of NKX3A (Accession NM\_006167), a gene which may regulate gene expression and control cell differentiation. Accordingly, utilities of VGAM681 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NKX3A. The function of NKX3A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM481. Ankyrin Repeat and SOCS Box-containing 13 (ASB13, Accession NM\_024701) is another VGAM681 host target gene. ASB13 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ASB13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ASB13 BINDING SITE, designated SEQ ID:24011, to the nucleotide sequence of VGAM681 RNA, herein designated VGAM RNA, also designated SEQ ID:3392.

[27827] Another function of VGAM681 is therefore inhibition of Ankyrin Repeat and SOCS Box-containing 13 (ASB13, Accession NM\_024701). Accordingly, utilities of VGAM681 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with ASB13. FLJ20273 (Accession NM\_019027) is another VGAM681 host target gene. FLJ20273 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20273, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20273 BINDING SITE, designated SEQ ID:21113, to the nucleotide sequence of VGAM681 RNA, herein designated VGAM RNA, also designated SEQ ID:3392.

[27828] Another function of VGAM681 is therefore inhibition of FLJ20273 (Accession NM\_019027). Accordingly, utilities of VGAM681 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20273. KIAA1336 (Accession XM\_051306) is another VGAM681 host target gene. KIAA1336 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1336, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1336 BINDING SITE, designated SEQ ID:35799, to the nucleotide sequence of

VGAM681 RNA, herein designated VGAM RNA, also designated SEQ ID:3392.

[27829] Another function of VGAM681 is therefore inhibition of KIAA1336 (Accession XM\_051306). Accordingly, utilities of VGAM681 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1336. LOC161742 (Accession XM\_091095) is another VGAM681 host target gene. LOC161742 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC161742, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC161742 BINDING SITE, designated SEQ ID:40025, to the nucleotide sequence of VGAM681 RNA, herein designated VGAM RNA, also designated SEQ ID:3392.

[27830] Another function of VGAM681 is therefore inhibition of LOC161742 (Accession XM\_091095). Accordingly, utilities of VGAM681 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC161742. LOC255919 (Accession XM\_170794) is another VGAM681 host target gene. LOC255919 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC255919, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255919 BINDING SITE, designated SEQ ID:45554, to the nucleotide sequence of VGAM681 RNA, herein designated VGAM RNA, also designated SEQ ID:3392.

[27831] Another function of VGAM681 is therefore inhibition of LOC255919 (Accession XM\_170794). Accordingly, utilities of VGAM681 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255919. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 682 (VGAM682) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27832] VGAM682 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM682 was detected is described hereinabove with reference to Figs. 1–8.

[27833] VGAM682 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Human Coronavirus 229E. VGAM682 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27834] VGAM682 gene encodes a VGAM682 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM682 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM682 precursor RNA is designated SEQ ID:668, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:668 is located at position 7304 relative to the genome of Human Coronavirus 229E.

[27835] VGAM682 precursor RNA folds onto itself, forming VGAM682 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27836] An enzyme complex designated DICER COMPLEX, `dices` the VGAM682 folded precursor RNA into VGAM682 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 56%) nucleotide sequence of VGAM682 RNA is designated SEQ ID:3393, and is provided hereinbelow with reference to the sequence listing part.

[27837] VGAM682 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM682 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM682 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[27838] VGAM682 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM682 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM682 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM682 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM682 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[27839] The complementary binding of VGAM682 RNA, herein designated VGAM RNA, to host target binding sites on VGAM682 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM682 host tar-

get RNA into VGAM682 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27840] It is appreciated that VGAM682 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM682 host target genes. The mRNA of each one of this plurality of VGAM682 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM682 RNA, herein designated VGAM RNA, and which when bound by VGAM682 RNA causes inhibition of translation of respective one or more VGAM682 host target proteins.

[27841] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM682 gene, herein designated VGAM GENE, on one or more VGAM682 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[27842] It is yet further appreciated that a function of VGAM682 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM682 include diagnosis, prevention and treatment of viral infection by Human Coronavirus 229E. Specific functions, and accordingly utilities, of VGAM682 correlate with, and may be deduced from, the identity of the host target genes which VGAM682 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27843] Nucleotide sequences of the VGAM682 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM682 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM682 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM682 are further

described hereinbelow with reference to Table 1.

[27844] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM682 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM682 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27845] As mentioned hereinabove with reference to Fig. 1, a function of VGAM682 gene, herein designated VGAM is inhibition of expression of VGAM682 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM682 correlate with, and may be deduced from, the identity of the target genes which VGAM682 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27846] Myeloid/lymphoid Or Mixed-lineage Leukemia (trithorax homolog, Drosophila); Translocated To, 2 (MLLT2, Accession NM\_005935) is a VGAM682 host target gene. MLLT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MLLT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of MLLT2 BINDING SITE, designated SEQ ID:12570, to the nucleotide sequence of VGAM682 RNA, herein designated VGAM RNA, also designated SEQ ID:3393.

[27847] A function of VGAM682 is therefore inhibition of Myeloid/lymphoid Or Mixed-lineage Leukemia (trithorax homolog, Drosophila); Translocated To, 2 (MLLT2, Accession NM\_005935), a gene which is a Putative transcription factor. Accordingly, utilities of VGAM682 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MLLT2. The function of MLLT2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM57. Protein S (alpha) (PROS1, Accession XM\_113400) is another VGAM682 host target gene. PROS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PROS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PROS1 BINDING SITE, designated SEQ ID:42255, to the nucleotide sequence of VGAM682 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:3393.

[27848] Another function of VGAM682 is therefore inhibition of Protein S (alpha) (PROS1, Accession XM\_113400). Accordingly, utilities of VGAM682 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PROS1. Thiopurine S-methyltransferase (TPMT, Accession NM\_000367) is another VGAM682 host target gene. TPMT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TPMT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TPMT BINDING SITE, designated SEQ ID:5940, to the nucleotide sequence of VGAM682 RNA, herein designated VGAM RNA, also designated SEQ ID:3393.

[27849] Another function of VGAM682 is therefore inhibition of Thiopurine S-methyltransferase (TPMT, Accession NM\_000367), a gene which catalyzes the s-methylation of thiopurine drugs such as 6-mercaptopurine. Accordingly, utilities of VGAM682 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TPMT. The function of TPMT has been established by previous studies. Thiopurine S-methyltransferase (TPMT;

S-adenosyl-L-methionine:thiopurine S-methyltransferase; EC 2.1.1.67) catalyzes thiopurine S-methylation, an important metabolic pathway for drugs such as 6-mercaptopurine. Weinshilboum and Sladek (1980) found trimodality for level of red cell TPMT among 298 randomly selected subjects: 88.6% had high enzyme activity; 11.1% had intermediate activity and 0.3% had undetectable activity. This distribution conforms to Hardy-Weinberg expectations for a pair of autosomal codominant alleles for low and high activity, TPMT-L and TPMT-H, with frequencies of 0.059 and 0.941, respectively. Segregation in families ascertained through probands with undetectable activity was consistent with this hypothesis. This genetic polymorphism may be an important factor in individual variations in sensitivity to thiopurines.

6-Mercaptopurine (6-MP) can be inactivated by S-methylation, which is catalyzed by thiopurine methyltransferase. An alternative metabolic route leads to the formation of cytotoxic 6-thioguanine nucleotides (6-TGN). Lennard et al. (1990) investigated whether these 2 pathways compete to affect the therapeutic response to 6-MP, by measuring 6-TGN concentrations and TPMT enzymatic activity in red cells of 95 children on long-term

6-MP therapy for acute lymphoblastic leukemia (ALL). Red cell TPMT activities were also measured in 130 control children and 104 long-term survivors of ALL no longer on treatment. In the children on 6-MP, red cell 6-TGN correlated negatively with red cell TPMT activity. Children with 6-TGN concentrations below the group mean had higher TPMT activities and a higher subsequent relapse rate. Fifty of the 104 long-term survivors had been treated with low-dose protocols; this subgroup contained an excess of children with lower TPMT activities. The results indicated that genetically determined TPMT activity may be an important regulator of the cytotoxic effect of 6-MP, an effect which in turn may be important in influencing the outcome of therapy for childhood ALL. Klemetsdal et al. (1993) found in a group of healthy subjects that red blood cell TPMT activity was 8.3% higher in male subjects than in female subjects. Alves et al. (1999) applied a PCR-SSCP method for TPMT-specific detection which introduces a substantial technical simplification, avoiding the use of restriction enzyme treatment after PCR amplification. Additionally, the method allowed the simultaneous detection of a 474T-C transition, a frequent silent mutation in the non-Portuguese population (TPMT\*1S = 0.215). In a sam-

ple of 310 unrelated Northern Portuguese individuals, 15 were found to be heterozygous for the TPMT\*3A allele (187680.0002) which is associated with TPMT enzymatic deficiency; the corresponding gene frequency estimate was 0.024. In an attempt to evaluate the relationship between the molecular TPMT genotype and reaction to treatments involving thiopurine drugs, Alves et al. (1999) analyzed a sample of 24 children who received curative therapy of acute lymphoblastic leukemia. Four of them were shown to be heterozygous for the TPMT\*3A allele. An examination of their clinical histories showed that all 4 patients exhibited signs of severe hepatic toxicity during treatment. McLeod et al. (1999) studied the frequency of common TPMT variant alleles in 101 Kenyan individuals and 199 Caucasians. The frequency of mutant alleles was similar between the Caucasian (10.1%) and Kenyan (10.9%) populations; however, all mutant alleles in the Kenyan population were TPMT\*3C (187680.0005) compared with 4.8% in Caucasians. In contrast, TPMT\*3A (187680.0002) was the most common mutant allele in the Caucasian individuals.

[27850] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [27851] Alves, S.; Prata, M.-J.; Ferreira, F.; Amorim, A. : Thiopurine methyltransferase pharmacogenetics: alternative molecular diagnosis and preliminary data from Northern Portugal. *Pharmacogenetics* 9: 257–261, 1999. ; and
- [27852] Ameyaw, M.-M.; Collie-Duguid, E. S. R.; Powrie, R. H.; Ofori-Adjei, D.; McLeod, H. L. : Thiopurine methyltransferase alleles in British and Ghanaian populations. *Hum. Molec. Genet.* 8: 3.
- [27853] Further studies establishing the function and utilities of TPMT are found in John Hopkins OMIM database record ID 187680, and in cited publications numbered 540–556 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. DKFZP566J091 (Accession NM\_030915) is another VGAM682 host target gene. DKFZP566J091 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP566J091, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP566J091 BINDING SITE, designated SEQ ID:25186, to the nucleotide sequence of VGAM682 RNA, herein designated VGAM RNA,

also designated SEQ ID:3393.

[27854] Another function of VGAM682 is therefore inhibition of DKFZP566J091 (Accession NM\_030915). Accordingly, utilities of VGAM682 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP566J091. ERAP140 (Accession XM\_059748) is another VGAM682 host target gene. ERAP140 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ERAP140, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ERAP140 BINDING SITE, designated SEQ ID:37082, to the nucleotide sequence of VGAM682 RNA, herein designated VGAM RNA, also designated SEQ ID:3393.

[27855] Another function of VGAM682 is therefore inhibition of ERAP140 (Accession XM\_059748). Accordingly, utilities of VGAM682 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ERAP140. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 683 (VGAM683) viral gene, which modulates expression of

respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27856] VGAM683 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM683 was detected is described hereinabove with reference to Figs. 1–8.

[27857] VGAM683 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Coronavirus 229E. VGAM683 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27858] VGAM683 gene encodes a VGAM683 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM683 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM683 precursor RNA is designated SEQ ID:669, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:669 is located at position 19339 relative to the genome of Human Coronavirus 229E.

[27859] VGAM683 precursor RNA folds onto itself, forming VGAM683 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, which has a two-dimensional  
`hairpin structure`. As is well known in the art, this  
`hairpin structure`, is typical of RNA encoded by miRNA  
genes, and is due to the fact that the nucleotide sequence  
of the first half of the RNA encoded by a miRNA gene is an  
accurate or partial inversed-reversed sequence of the nu-  
cleotide sequence of the second half thereof.

[27860] An enzyme complex designated DICER COMPLEX, `dices`  
the VGAM683 folded precursor RNA into VGAM683 RNA,  
herein designated VGAM RNA, a single stranded ~22 nt  
long RNA segment. As is known in the art, `dicing` of a  
hairpin structured RNA precursor product into a short  
~22nt RNA segment is catalyzed by an enzyme complex  
comprising an enzyme called Dicer together with other  
necessary proteins. A probable (over 45%) nucleotide se-  
quence of VGAM683 RNA is designated SEQ ID:3394, and  
is provided hereinbelow with reference to the sequence  
listing part.

[27861] VGAM683 host target gene, herein designated VGAM  
HOST TARGET GENE, encodes a corresponding messenger  
RNA, VGAM683 host target RNA, herein designated VGAM  
HOST TARGET RNA. VGAM683 host target RNA comprises  
three regions, as is typical of mRNA of a protein coding

gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[27862] VGAM683 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM683 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM683 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM683 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM683 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[27863] The complementary binding of VGAM683 RNA, herein designated VGAM RNA, to host target binding sites on VGAM683 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM683 host target RNA into VGAM683 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27864] It is appreciated that VGAM683 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM683 host target genes. The mRNA of each one of this plurality of VGAM683 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM683 RNA, herein designated VGAM RNA, and which when bound by VGAM683 RNA causes inhibition of translation of respective one or more VGAM683 host target proteins.

[27865] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM683 gene, herein designated VGAM GENE, on one or more VGAM683 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[27866] It is yet further appreciated that a function of VGAM683 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM683 include diagnosis, prevention and treatment of viral infection by Human Coronavirus 229E. Specific functions, and accordingly utilities, of VGAM683 correlate with, and may be deduced from, the identity of the host target genes which VGAM683 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[27867] Nucleotide sequences of the VGAM683 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM683 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM683 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM683 are further described hereinbelow with reference to Table 1.

[27868] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM683 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM683 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27869] As mentioned hereinabove with reference to Fig. 1, a function of VGAM683 gene, herein designated VGAM is inhibition of expression of VGAM683 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM683 correlate with, and may be deduced from, the identity of the target genes which VGAM683 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27870] Nuclear Factor I/A (NFIA, Accession XM\_046827) is a VGAM683 host target gene. NFIA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NFIA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NFIA BINDING SITE, designated SEQ ID:34838, to the nucleotide sequence of VGAM683 RNA, herein designated VGAM RNA, also designated SEQ ID:3394.

[27871] A function of VGAM683 is therefore inhibition of Nuclear Factor I/A (NFIA, Accession XM\_046827). Accordingly, utilities of VGAM683 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NFIA. Solute Carrier Family 20 (phosphate transporter), Member 1 (SLC20A1, Accession XM\_002217) is another VGAM683 host target gene. SLC20A1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SLC20A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC20A1 BINDING SITE, designated SEQ ID:29872, to the

nucleotide sequence of VGAM683 RNA, herein designated VGAM RNA, also designated SEQ ID:3394.

[27872] Another function of VGAM683 is therefore inhibition of Solute Carrier Family 20 (phosphate transporter), Member 1 (SLC20A1, Accession XM\_002217), a gene which could be a sodium–phosphate symporter. Accordingly, utilities of VGAM683 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC20A1. The function of SLC20A1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM608.FLJ13782 (Accession NM\_024915) is another VGAM683 host target gene. FLJ13782 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13782, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13782 BINDING SITE, designated SEQ ID:24438, to the nucleotide sequence of VGAM683 RNA, herein designated VGAM RNA, also designated SEQ ID:3394.

[27873] Another function of VGAM683 is therefore inhibition of

FLJ13782 (Accession NM\_024915). Accordingly, utilities of VGAM683 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13782. FLJ14054 (Accession NM\_024563) is another VGAM683 host target gene. FLJ14054 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14054, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14054 BINDING SITE, designated SEQ ID:23782, to the nucleotide sequence of VGAM683 RNA, herein designated VGAM RNA, also designated SEQ ID:3394.

[27874] Another function of VGAM683 is therefore inhibition of FLJ14054 (Accession NM\_024563). Accordingly, utilities of VGAM683 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14054. GCN2 (Accession XM\_031612) is another VGAM683 host target gene. GCN2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GCN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of GCN2 BINDING SITE, designated SEQ ID:31445, to the nucleotide sequence of VGAM683 RNA, herein designated VGAM RNA, also designated SEQ ID:3394.

[27875] Another function of VGAM683 is therefore inhibition of GCN2 (Accession XM\_031612). Accordingly, utilities of VGAM683 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GCN2. KIAA0570 (Accession NM\_014709) is another VGAM683 host target gene. KIAA0570 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0570, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0570 BINDING SITE, designated SEQ ID:16254, to the nucleotide sequence of VGAM683 RNA, herein designated VGAM RNA, also designated SEQ ID:3394.

[27876] Another function of VGAM683 is therefore inhibition of KIAA0570 (Accession NM\_014709). Accordingly, utilities of VGAM683 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0570. TIP-1 (Accession NM\_014604) is another

VGAM683 host target gene. TIP-1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TIP-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIP-1 BINDING SITE, designated SEQ ID:15967, to the nucleotide sequence of VGAM683 RNA, herein designated VGAM RNA, also designated SEQ ID:3394.

[27877] Another function of VGAM683 is therefore inhibition of TIP-1 (Accession NM\_014604). Accordingly, utilities of VGAM683 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIP-1. LOC152765 (Accession XM\_087519) is another VGAM683 host target gene. LOC152765 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152765, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152765 BINDING SITE, designated SEQ ID:39313, to the nucleotide sequence of VGAM683 RNA, herein designated VGAM RNA, also designated SEQ ID:3394.

[27878] Another function of VGAM683 is therefore inhibition of LOC152765 (Accession XM\_087519). Accordingly, utilities of VGAM683 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152765. LOC163412 (Accession XM\_088868) is another VGAM683 host target gene. LOC163412 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC163412, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163412 BINDING SITE, designated SEQ ID:39954, to the nucleotide sequence of VGAM683 RNA, herein designated VGAM RNA, also designated SEQ ID:3394.

[27879] Another function of VGAM683 is therefore inhibition of LOC163412 (Accession XM\_088868). Accordingly, utilities of VGAM683 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163412. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 684 (VGAM684) viral gene, which modulates expression of respective host target genes thereof,

the function and utility of which host target genes is known in the art.

[27880] VGAM684 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM684 was detected is described hereinabove with reference to Figs. 1–8.

[27881] VGAM684 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Coronavirus 229E. VGAM684 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27882] VGAM684 gene encodes a VGAM684 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM684 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM684 precursor RNA is designated SEQ ID:670, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:670 is located at position 18943 relative to the genome of Human Coronavirus 229E.

[27883] VGAM684 precursor RNA folds onto itself, forming VGAM684 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, which has a two-dimensional  
`hairpin structure`. As is well known in the art, this  
`hairpin structure`, is typical of RNA encoded by miRNA  
genes, and is due to the fact that the nucleotide sequence  
of the first half of the RNA encoded by a miRNA gene is an  
accurate or partial inversed-reversed sequence of the nu-  
cleotide sequence of the second half thereof.

[27884] An enzyme complex designated DICER COMPLEX, `dices`  
the VGAM684 folded precursor RNA into VGAM684 RNA,  
herein designated VGAM RNA, a single stranded ~22 nt  
long RNA segment. As is known in the art, `dicing` of a  
hairpin structured RNA precursor product into a short  
~22nt RNA segment is catalyzed by an enzyme complex  
comprising an enzyme called Dicer together with other  
necessary proteins. A probable (over 42%) nucleotide se-  
quence of VGAM684 RNA is designated SEQ ID:3395, and  
is provided hereinbelow with reference to the sequence  
listing part.

[27885] VGAM684 host target gene, herein designated VGAM  
HOST TARGET GENE, encodes a corresponding messenger  
RNA, VGAM684 host target RNA, herein designated VGAM  
HOST TARGET RNA. VGAM684 host target RNA comprises  
three regions, as is typical of mRNA of a protein coding

gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[27886] VGAM684 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM684 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM684 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM684 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM684 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[27887] The complementary binding of VGAM684 RNA, herein designated VGAM RNA, to host target binding sites on VGAM684 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM684 host target RNA into VGAM684 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27888] It is appreciated that VGAM684 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM684 host target genes. The mRNA of each one of this plurality of VGAM684 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM684 RNA, herein designated VGAM RNA, and which when bound by VGAM684 RNA causes inhibition of translation of respective one or more VGAM684 host target proteins.

[27889] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM684 gene, herein designated VGAM GENE, on one or more VGAM684 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[27890] It is yet further appreciated that a function of VGAM684 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM684 include diagnosis, prevention and treatment of viral infection by Human Coronavirus 229E. Specific functions, and accordingly utilities, of VGAM684 correlate with, and may be deduced from, the identity of the host target genes which VGAM684 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[27891] Nucleotide sequences of the VGAM684 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM684 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM684 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM684 are further described hereinbelow with reference to Table 1.

[27892] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM684 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM684 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27893] As mentioned hereinabove with reference to Fig. 1, a function of VGAM684 gene, herein designated VGAM is inhibition of expression of VGAM684 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM684 correlate with, and may be deduced from, the identity of the target genes which VGAM684 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27894] Guanine Nucleotide Binding Protein (G protein), Alpha 15 (Gq class) (GNA15, Accession XM\_009220) is a VGAM684 host target gene. GNA15 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GNA15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GNA15 BINDING SITE, designated SEQ ID:30106, to the nucleotide sequence of VGAM684 RNA, herein designated VGAM RNA, also designated SEQ ID:3395.

[27895] A function of VGAM684 is therefore inhibition of Guanine Nucleotide Binding Protein (G protein), Alpha 15 (Gq class) (GNA15, Accession XM\_009220). Accordingly, utilities of VGAM684 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNA15. FLJ10620 (Accession NM\_018157) is another VGAM684 host target gene. FLJ10620 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10620, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10620 BINDING SITE,

designated SEQ ID:19972, to the nucleotide sequence of VGAM684 RNA, herein designated VGAM RNA, also designated SEQ ID:3395.

[27896] Another function of VGAM684 is therefore inhibition of FLJ10620 (Accession NM\_018157). Accordingly, utilities of VGAM684 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10620. HCGIV.9 (Accession NM\_018985) is another VGAM684 host target gene. HCGIV.9 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HCGIV.9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HCGIV.9 BINDING SITE, designated SEQ ID:21057, to the nucleotide sequence of VGAM684 RNA, herein designated VGAM RNA, also designated SEQ ID:3395.

[27897] Another function of VGAM684 is therefore inhibition of HCGIV.9 (Accession NM\_018985). Accordingly, utilities of VGAM684 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HCGIV.9. TNF Receptor-associated Factor 3 (TRAF3, Accession XM\_007256) is another VGAM684 host target gene. TRAF3

BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRAF3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRAF3 BINDING SITE, designated SEQ ID:30048, to the nucleotide sequence of VGAM684 RNA, herein designated VGAM RNA, also designated SEQ ID:3395.

[27898] Another function of VGAM684 is therefore inhibition of TNF Receptor-associated Factor 3 (TRAF3, Accession XM\_007256). Accordingly, utilities of VGAM684 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRAF3. LOC145255 (Accession XM\_096748) is another VGAM684 host target gene. LOC145255 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145255, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145255 BINDING SITE, designated SEQ ID:40527, to the nucleotide sequence of VGAM684 RNA, herein designated VGAM RNA, also designated SEQ ID:3395.

[27899] Another function of VGAM684 is therefore inhibition of LOC145255 (Accession XM\_096748). Accordingly, utilities of VGAM684 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145255. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 685 (VGAM685) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27900] VGAM685 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM685 was detected is described hereinabove with reference to Figs. 1–8.

[27901] VGAM685 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Coronavirus 229E. VGAM685 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27902] VGAM685 gene encodes a VGAM685 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM685

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM685 precursor RNA is designated SEQ ID:671, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:671 is located at position 8018 relative to the genome of Human Coronavirus 229E.

[27903] VGAM685 precursor RNA folds onto itself, forming VGAM685 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27904] An enzyme complex designated DICER COMPLEX, `dices` the VGAM685 folded precursor RNA into VGAM685 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 45%) nucleotide sequence of VGAM685 RNA is designated SEQ ID:3396, and is provided hereinbelow with reference to the sequence listing part.

[27905] VGAM685 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM685 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM685 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[27906] VGAM685 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM685 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM685 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM685 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM685 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[27907] The complementary binding of VGAM685 RNA, herein designated VGAM RNA, to host target binding sites on VGAM685 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM685 host target RNA into VGAM685 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27908] It is appreciated that VGAM685 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM685 host target genes. The mRNA of each one of this plurality of VGAM685 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM685 RNA, herein designated VGAM RNA, and which when bound by VGAM685 RNA causes inhibition of translation of respective one or more VGAM685 host target proteins.

[27909] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM685 gene, herein designated VGAM GENE, on one or more VGAM685 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[27910] It is yet further appreciated that a function of VGAM685 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM685 include diagnosis, prevention and treatment of viral infection by Human Coronavirus 229E. Specific functions, and accordingly utilities, of VGAM685 correlate with, and may be deduced from, the identity of the host target genes which VGAM685 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27911] Nucleotide sequences of the VGAM685 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM685 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM685 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM685 are further described hereinbelow with reference to Table 1.

[27912] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM685 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM685 RNA, herein designated VGAM RNA, are described hereinbelow with refer-

ence to Table 2.

[27913] As mentioned hereinabove with reference to Fig. 1, a function of VGAM685 gene, herein designated VGAM is inhibition of expression of VGAM685 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM685 correlate with, and may be deduced from, the identity of the target genes which VGAM685 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27914] Potassium Inwardly-rectifying Channel, Subfamily J, Member 14 (KCNJ14, Accession NM\_013348) is a VGAM685 host target gene. KCNJ14 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KCNJ14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNJ14 BINDING SITE, designated SEQ ID:14993, to the nucleotide sequence of VGAM685 RNA, herein designated VGAM RNA, also designated SEQ ID:3396.

[27915] A function of VGAM685 is therefore inhibition of Potassium Inwardly-rectifying Channel, Subfamily J, Member 14 (KCNJ14, Accession NM\_013348). Accordingly, utilities of

VGAM685 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNJ14. KIAA0431 (Accession NM\_015251) is another VGAM685 host target gene. KIAA0431 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0431, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0431 BINDING SITE, designated SEQ ID:17580, to the nucleotide sequence of VGAM685 RNA, herein designated VGAM RNA, also designated SEQ ID:3396.

[27916] Another function of VGAM685 is therefore inhibition of KIAA0431 (Accession NM\_015251). Accordingly, utilities of VGAM685 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0431. KIAA1371 (Accession XM\_114371) is another VGAM685 host target gene. KIAA1371 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1371, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1371 BINDING SITE, designated SEQ ID:42909, to the nucleotide sequence of VGAM685 RNA, herein designated VGAM RNA, also designated SEQ ID:3396.

[27917] Another function of VGAM685 is therefore inhibition of KIAA1371 (Accession XM\_114371). Accordingly, utilities of VGAM685 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1371. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 686 (VGAM686) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27918] VGAM686 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM686 was detected is described hereinabove with reference to Figs. 1–8.

[27919] VGAM686 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Coronavirus 229E. VGAM686 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27920] VGAM686 gene encodes a VGAM686 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM686 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM686 precursor RNA is designated SEQ ID:672, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:672 is located at position 14152 relative to the genome of Human Coronavirus 229E.

[27921] VGAM686 precursor RNA folds onto itself, forming VGAM686 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27922] An enzyme complex designated DICER COMPLEX, `dices` the VGAM686 folded precursor RNA into VGAM686 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM686 RNA is designated SEQ ID:3397, and is provided hereinbelow with reference to the sequence listing part.

[27923] VGAM686 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM686 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM686 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[27924] VGAM686 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM686 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM686 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM686 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM686 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[27925] The complementary binding of VGAM686 RNA, herein designated VGAM RNA, to host target binding sites on VGAM686 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM686 host target RNA into VGAM686 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27926] It is appreciated that VGAM686 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM686 host target genes. The mRNA of each one of this plurality of VGAM686 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM686 RNA, herein designated VGAM RNA, and which when bound by VGAM686 RNA causes inhibition of translation of respective one or more VGAM686 host target proteins.

[27927] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM686 gene, herein designated VGAM GENE, on one or more VGAM686 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,  
`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[27928] It is yet further appreciated that a function of VGAM686 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM686 include diagnosis, prevention and treatment of viral infection by Human Coronavirus 229E. Specific functions, and accordingly utilities, of VGAM686 correlate with, and may be deduced from, the identity of the host target genes which VGAM686 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27929] Nucleotide sequences of the VGAM686 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM686 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM686 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM686 are further described hereinbelow with reference to Table 1.

[27930] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM686 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM686 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27931] As mentioned hereinabove with reference to Fig. 1, a function of VGAM686 gene, herein designated VGAM is inhibition of expression of VGAM686 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM686 correlate with, and may be deduced from, the identity of the target genes which VGAM686 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27932] COX11 Homolog, Cytochrome C Oxidase Assembly Protein (yeast) (COX11, Accession NM\_004375) is a VGAM686 host target gene. COX11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by COX11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COX11 BINDING SITE, designated SEQ ID:10595, to the nucleotide sequence of VGAM686 RNA, herein designated VGAM RNA, also designated SEQ ID:3397.

[27933] A function of VGAM686 is therefore inhibition of COX11 Homolog, Cytochrome C Oxidase Assembly Protein (yeast) (COX11, Accession NM\_004375). Accordingly, utilities of VGAM686 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COX11. UDP-N-acetyl-alpha-D-galactosamine:polypeptide N-acetylgalactosaminyltransferase 7 (GalNAc-T7) (GALNT7, Accession NM\_017423) is another VGAM686 host target gene. GALNT7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GALNT7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GALNT7 BINDING SITE, designated SEQ ID:18880, to the nucleotide sequence of VGAM686 RNA, herein designated VGAM RNA, also designated SEQ ID:3397.

[27934] Another function of VGAM686 is therefore inhibition of UDP-N-acetyl-alpha-D-galactosamine:polypeptide N-acetylgalactosaminyltransferase 7 (GalNAc-T7) (GALNT7, Accession NM\_017423). Accordingly, utilities of VGAM686 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GALNT7. BTB (POZ)

Domain Containing 1 (BTBD1, Accession NM\_025238) is another VGAM686 host target gene. BTBD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BTBD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BTBD1 BINDING SITE, designated SEQ ID:24922, to the nucleotide sequence of VGAM686 RNA, herein designated VGAM RNA, also designated SEQ ID:3397.

[27935] Another function of VGAM686 is therefore inhibition of BTB (POZ) Domain Containing 1 (BTBD1, Accession NM\_025238). Accordingly, utilities of VGAM686 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BTBD1. DKFZP564D166 (Accession NM\_030658) is another VGAM686 host target gene. DKFZP564D166 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564D166, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564D166 BINDING SITE, designated SEQ ID:24990, to the nucleotide

sequence of VGAM686 RNA, herein designated VGAM RNA, also designated SEQ ID:3397.

[27936] Another function of VGAM686 is therefore inhibition of DKFZP564D166 (Accession NM\_030658). Accordingly, utilities of VGAM686 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564D166. FLJ23053 (Accession NM\_022907) is another VGAM686 host target gene. FLJ23053 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23053, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23053 BINDING SITE, designated SEQ ID:23205, to the nucleotide sequence of VGAM686 RNA, herein designated VGAM RNA, also designated SEQ ID:3397.

[27937] Another function of VGAM686 is therefore inhibition of FLJ23053 (Accession NM\_022907). Accordingly, utilities of VGAM686 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23053. KH Domain Containing, RNA Binding, Signal Transduction Associated 1 (KHDRBS1, Accession NM\_006559) is another VGAM686 host target gene. KHDRBS1 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KHDRBS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KHDRBS1 BINDING SITE, designated SEQ ID:13329, to the nucleotide sequence of VGAM686 RNA, herein designated VGAM RNA, also designated SEQ ID:3397.

[27938] Another function of VGAM686 is therefore inhibition of KH Domain Containing, RNA Binding, Signal Transduction Associated 1 (KHDRBS1, Accession NM\_006559). Accordingly, utilities of VGAM686 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KHDRBS1. KIAA1393 (Accession XM\_050793) is another VGAM686 host target gene. KIAA1393 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1393, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1393 BINDING SITE, designated SEQ ID:35690, to the nucleotide sequence of VGAM686 RNA, herein designated VGAM RNA, also designated SEQ ID:3397.

[27939] Another function of VGAM686 is therefore inhibition of KIAA1393 (Accession XM\_050793). Accordingly, utilities of VGAM686 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1393. PORIMIN (Accession NM\_052932) is another VGAM686 host target gene. PORIMIN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PORIMIN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PORIMIN BINDING SITE, designated SEQ ID:27490, to the nucleotide sequence of VGAM686 RNA, herein designated VGAM RNA, also designated SEQ ID:3397.

[27940] Another function of VGAM686 is therefore inhibition of PORIMIN (Accession NM\_052932). Accordingly, utilities of VGAM686 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PORIMIN. RNAH (Accession XM\_030392) is another VGAM686 host target gene. RNAH BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNAH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of RNAH BINDING SITE, designated SEQ ID:31038, to the nucleotide sequence of VGAM686 RNA, herein designated VGAM RNA, also designated SEQ ID:3397.

[27941] Another function of VGAM686 is therefore inhibition of RNAH (Accession XM\_030392). Accordingly, utilities of VGAM686 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNAH. LOC158714 (Accession XM\_088650) is another VGAM686 host target gene. LOC158714 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158714, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158714 BINDING SITE, designated SEQ ID:39886, to the nucleotide sequence of VGAM686 RNA, herein designated VGAM RNA, also designated SEQ ID:3397.

[27942] Another function of VGAM686 is therefore inhibition of LOC158714 (Accession XM\_088650). Accordingly, utilities of VGAM686 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC158714. LOC221362 (Accession XM\_168093) is another VGAM686 host target gene. LOC221362 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221362, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221362 BINDING SITE, designated SEQ ID:45023, to the nucleotide sequence of VGAM686 RNA, herein designated VGAM RNA, also designated SEQ ID:3397.

[27943] Another function of VGAM686 is therefore inhibition of LOC221362 (Accession XM\_168093). Accordingly, utilities of VGAM686 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221362. LOC255158 (Accession XM\_171213) is another VGAM686 host target gene. LOC255158 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255158, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255158 BINDING SITE, designated SEQ ID:46000, to the nucleotide sequence of VGAM686 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3397.

[27944] Another function of VGAM686 is therefore inhibition of LOC255158 (Accession XM\_171213). Accordingly, utilities of VGAM686 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255158. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 687 (VGAM687) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27945] VGAM687 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM687 was detected is described hereinabove with reference to Figs. 1–8.

[27946] VGAM687 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Coronavirus 229E. VGAM687 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27947] VGAM687 gene encodes a VGAM687 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM687 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM687 precursor RNA is designated SEQ ID:673, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:673 is located at position 14557 relative to the genome of Human Coronavirus 229E.

[27948] VGAM687 precursor RNA folds onto itself, forming VGAM687 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27949] An enzyme complex designated DICER COMPLEX, `dices` the VGAM687 folded precursor RNA into VGAM687 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM687 RNA is designated SEQ ID:3398, and is provided hereinbelow with reference to the sequence listing part.

[27950] VGAM687 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM687 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM687 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[27951] VGAM687 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM687 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM687 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM687 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM687 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[27952] The complementary binding of VGAM687 RNA, herein designated VGAM RNA, to host target binding sites on VGAM687 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM687 host target RNA into VGAM687 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27953] It is appreciated that VGAM687 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM687 host target genes. The mRNA of

each one of this plurality of VGAM687 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM687 RNA, herein designated VGAM RNA, and which when bound by VGAM687 RNA causes inhibition of translation of respective one or more VGAM687 host target proteins.

[27954] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM687 gene, herein designated VGAM GENE, on one or more VGAM687 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[27955] It is yet further appreciated that a function of VGAM687 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM687 include diagnosis, prevention and treatment of viral infection by Human Coronavirus 229E. Specific functions, and accordingly utilities, of VGAM687 correlate with, and may be deduced from, the identity of the host target genes which VGAM687 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27956] Nucleotide sequences of the VGAM687 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM687 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM687 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM687 are further described hereinbelow with reference to Table 1.

[27957] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM687 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM687 RNA, herein desig-

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[27958] As mentioned hereinabove with reference to Fig. 1, a function of VGAM687 gene, herein designated VGAM is inhibition of expression of VGAM687 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM687 correlate with, and may be deduced from, the identity of the target genes which VGAM687 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27959] KIAA0022 (Accession NM\_014880) is a VGAM687 host target gene. KIAA0022 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0022, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0022 BINDING SITE, designated SEQ ID:17024, to the nucleotide sequence of VGAM687 RNA, herein designated VGAM RNA, also designated SEQ ID:3398.

[27960] A function of VGAM687 is therefore inhibition of KIAA0022 (Accession NM\_014880). Accordingly, utilities of VGAM687 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA0022. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 688 (VGAM688) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27961] VGAM688 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM688 was detected is described hereinabove with reference to Figs. 1–8.

[27962] VGAM688 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Coronavirus 229E. VGAM688 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27963] VGAM688 gene encodes a VGAM688 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM688 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM688 precursor RNA is designated SEQ

ID:674, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:674 is located at position 7056 relative to the genome of Human Coronavirus 229E.

[27964] VGAM688 precursor RNA folds onto itself, forming VGAM688 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27965] An enzyme complex designated DICER COMPLEX, `dices` the VGAM688 folded precursor RNA into VGAM688 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM688 RNA is designated SEQ ID:3399, and is provided hereinbelow with reference to the sequence

listing part.

[27966] VGAM688 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM688 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM688 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[27967] VGAM688 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM688 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM688 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM688 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM688 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[27968] The complementary binding of VGAM688 RNA, herein designated VGAM RNA, to host target binding sites on VGAM688 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM688 host target RNA into VGAM688 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27969] It is appreciated that VGAM688 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM688 host target genes. The mRNA of each one of this plurality of VGAM688 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM688 RNA, herein designated VGAM

RNA, and which when bound by VGAM688 RNA causes inhibition of translation of respective one or more VGAM688 host target proteins.

[27970] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM688 gene, herein designated VGAM GENE, on one or more VGAM688 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[27971] It is yet further appreciated that a function of VGAM688 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM688 include diagnosis, prevention and treatment of viral infection by Human Coronavirus 229E. Specific functions, and accordingly utilities, of VGAM688 correlate with, and may be deduced from, the identity of the host target genes which VGAM688 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27972] Nucleotide sequences of the VGAM688 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM688 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM688 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM688 are further described hereinbelow with reference to Table 1.

[27973] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM688 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM688 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27974] As mentioned hereinabove with reference to Fig. 1, a function of VGAM688 gene, herein designated VGAM is

inhibition of expression of VGAM688 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM688 correlate with, and may be deduced from, the identity of the target genes which VGAM688 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27975] LANGERIN (Accession NM\_015717) is a VGAM688 host target gene. LANGERIN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LANGERIN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LANGERIN BINDING SITE, designated SEQ ID:17930, to the nucleotide sequence of VGAM688 RNA, herein designated VGAM RNA, also designated SEQ ID:3399.

[27976] A function of VGAM688 is therefore inhibition of LANGERIN (Accession NM\_015717), a gene which could be involved in endocytosis. Accordingly, utilities of VGAM688 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LANGERIN. The function of LANGERIN has been established by previous studies. Dendritic cells (DCs) process exogenous antigen

within major histocompatibility complex (MHC) class II-rich endosome/lysosome compartments to allow presentation to CD4 (OMIM Ref. No. 186940)-positive T cells. They also route exogenous antigen into the MHC class I pathway for presentation to CD8 (OMIM Ref. No. 186910)-positive T cells by a mechanism known as cross priming. Langerhans cells (LCs) are immature DCs of the epidermis and mucosal tissues; see 604856. Birbeck granules (BGs) are organelles in the cytoplasm of LCs that have a 'tennis racket' appearance consisting of superimposed and zippered membranes. Using a monoclonal antibody to screen a DC cDNA library expressed in fibroblasts, Valladeau et al. (2000) isolated a cDNA encoding a 328-amino acid type II transmembrane protein, which they named langerin. Sequence analysis identified a calcium dependent (OMIM Ref. No. C-type) lectin domain; a glu-pro-asn motif, predicting mannose recognition; a proline-rich potential signal-transduction motif; and 2 potential N-glycosylation sites. The langerin protein is 66% identical to its mouse homolog (Valladeau et al., 2002). RT-PCR analysis detected abundant expression of langerin in freshly isolated LCs. Lower levels were detected in cultured DCs, and no expression was detected in

monocytes, T lymphocytes, granulocytes, B lymphocytes, and skin basal cells. Northern blot analysis of normal tissues detected strong expression of a 2.0-kb langerin transcript in lung but not in pancreas, kidney, skeletal muscle, liver, placenta, brain, heart, bone marrow, and peripheral blood leukocytes. Western blot analysis of DCs cultured with transforming growth factor-beta (OMIM Ref. No. 190180) showed expression of a 40-kD protein, similar to the predicted molecular mass. Confocal microscopy detected langerin at the LC cell surface and also in the cytoplasm. Electron microscopy detected langerin inside intracellular BGs but not in MHC class II-rich compartments. Valladeau et al. (2000) showed that expression of langerin induces membrane superimposition and zippering to produce BGs. They proposed that mannose binding by langerin leads to internalization of antigen into BGs and possibly access to the class I pathway.

[27977] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[27978] Valladeau, J.; Clair-Moninot, V.; Dezutter-Dambuyant, C.; Pin, J.-J.; Kissenpfennig, A.; Mattei, M.-G.; Ait-Yahia, S.; Bates, E. E. M.; Malissen, B.; Koch, F.; Fossiez, F.; Romani,

N.; Lebecque, S.; Saeland, S. : Identification of mouse langerin/CD207 in Langerhans cells and some dendritic cells of lymphoid tissues. J. Immun. 168: 782–792, 2002. ; and

[27979] Valladeau, J.; Ravel, O.; Dezutter–Dambuyant, C.; Moore, K.; Kleijmeer, M.; Liu, Y.; Duvert–Frances, V.; Vincent, C.; Schmitt, D.; Davoust, J.; Caux, C.; Lebecque, S.; Saeland, S. : Lan.

[27980] Further studies establishing the function and utilities of LANGERIN are found in John Hopkins OMIM database record ID 604862, and in cited publications numbered 7298–7299 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Midline 1 (Opitz/BBB syndrome) (MID1, Accession NM\_000381) is another VGAM688 host target gene. MID1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MID1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MID1 BINDING SITE, designated SEQ ID:5956, to the nucleotide sequence of VGAM688 RNA, herein designated VGAM RNA, also designated SEQ ID:3399.

[27981] Another function of VGAM688 is therefore inhibition of

Midline 1 (Opitz/BBB syndrome) (MID1, Accession NM\_000381). Accordingly, utilities of VGAM688 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MID1. KIAA0461 (Accession XM\_047883) is another VGAM688 host target gene.

KIAA0461 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0461, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0461 BINDING SITE, designated SEQ ID:35076, to the nucleotide sequence of VGAM688 RNA, herein designated VGAM RNA, also designated SEQ ID:3399.

[27982] Another function of VGAM688 is therefore inhibition of KIAA0461 (Accession XM\_047883). Accordingly, utilities of VGAM688 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0461. LOC131000 (Accession XM\_067145) is another VGAM688 host target gene. LOC131000 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC131000, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC131000 BINDING SITE, designated SEQ ID:37350, to the nucleotide sequence of VGAM688 RNA, herein designated VGAM RNA, also designated SEQ ID:3399.

[27983] Another function of VGAM688 is therefore inhibition of LOC131000 (Accession XM\_067145). Accordingly, utilities of VGAM688 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC131000. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 689 (VGAM689) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27984] VGAM689 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM689 was detected is described hereinabove with reference to Figs. 1–8.

[27985] VGAM689 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Coronavirus 229E. VGAM689 host target gene, herein designated

VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27986] VGAM689 gene encodes a VGAM689 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM689 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM689 precursor RNA is designated SEQ ID:675, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:675 is located at position 19049 relative to the genome of Human Coronavirus 229E.

[27987] VGAM689 precursor RNA folds onto itself, forming VGAM689 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27988] An enzyme complex designated DICER COMPLEX, `dices` the VGAM689 folded precursor RNA into VGAM689 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 53%) nucleotide sequence of VGAM689 RNA is designated SEQ ID:3400, and is provided hereinbelow with reference to the sequence listing part.

[27989] VGAM689 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM689 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM689 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[27990] VGAM689 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM689 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM689 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM689 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM689 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[27991] The complementary binding of VGAM689 RNA, herein designated VGAM RNA, to host target binding sites on VGAM689 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM689 host target RNA into VGAM689 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[27992] It is appreciated that VGAM689 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM689 host target genes. The mRNA of each one of this plurality of VGAM689 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM689 RNA, herein designated VGAM RNA, and which when bound by VGAM689 RNA causes inhibition of translation of respective one or more VGAM689 host target proteins.

[27993] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM689 gene, herein designated VGAM GENE, on one or more VGAM689 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[27994] It is yet further appreciated that a function of VGAM689 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM689 include diagnosis, prevention and treatment of viral infection by Human Coronavirus 229E. Specific functions, and accordingly utilities, of VGAM689 correlate with, and may be deduced from, the identity of the host target genes which VGAM689 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27995] Nucleotide sequences of the VGAM689 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM689 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM689 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM689 are further described hereinbelow with reference to Table 1.

[27996] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM689 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM689 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27997] As mentioned hereinabove with reference to Fig. 1, a function of VGAM689 gene, herein designated VGAM is inhibition of expression of VGAM689 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM689 correlate with, and may be deduced from, the identity of the target genes which VGAM689 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27998] Nuclear Receptor Subfamily 2, Group E, Member 1 (NR2E1, Accession NM\_003269) is a VGAM689 host target gene. NR2E1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NR2E1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NR2E1 BINDING SITE, designated SEQ ID:9277, to the nucleotide sequence of VGAM689 RNA, herein des-

ignated VGAM RNA, also designated SEQ ID:3400.

[27999] A function of VGAM689 is therefore inhibition of Nuclear Receptor Subfamily 2, Group E, Member 1 (NR2E1, Accession NM\_003269), a gene which may be required for brain development and be involved in the regulation of retinal development . Accordingly, utilities of VGAM689 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NR2E1. The function of NR2E1 has been established by previous studies. The product of the *Drosophila* terminal/gap gene 'tailless' (tll) is expressed in the embryonic brain and is required for brain development in flies. The tll protein is a ligand-activated nuclear receptor-type transcription factor. In 2 discrete subregions of the DNA-binding domain (DBD) that modulate the mode of DNA binding, the tll protein contains changes that distinguish it from all other nuclear receptors. Yu et al. (1994) identified the chick and mouse Tlx genes, encoding the vertebrate tll homolog. The vertebrate Tlx proteins are highly conserved, and both avian and mammalian Tlx contain the distinct tll DBD sequences. In vitro DNA-binding assays demonstrated that Tlx and tll share a target gene specificity that is unique among the nuclear receptor superfamily. Ectopic expres-

sion of chick Tlx in fly embryos caused a repression of segmentation comparable to that elicited by tll. In situ hybridization to chick and mouse embryos revealed that Tlx is expressed in the head ectoderm in early embryos. At later stages, cells expressing Tlx are localized in the ventricular zone of the neuroepithelial layer, suggesting that Tlx is involved in transcriptional control in undifferentiated neuroepithelial cells in the anterior regions of the developing vertebrate brain. By searching for genes located within the 6q21–q23 region of minimal deletion (RMD) associated with hematologic malignancies, Jackson et al. (1998) identified the human TLX homolog, also called NR2E1. The TLX gene contains 9 exons and spans 24 kb. By a combination of direct sequencing, exon trapping, and library screening, they isolated human TLX cDNAs. The predicted 386–amino acid human protein shares 97% and 99% identity with chick and mouse TLX, respectively. The highest degree of similarity between TLX and *Drosophila* tll is within the DBDs and the ligand-binding domains (LBDs) of the proteins. Northern blot analysis revealed that the approximately 3.9–kb TLX mRNA is expressed exclusively in brain.

[28000] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [28001] Jackson, A.; Panayiotidis, P.; Foroni, L. : The human homologue of the *Drosophila* tailless gene (TLX): characterization and mapping to a region of common deletion in human lymphoid leukemia on chromosome 6q21. *Genomics* 50: 34–43, 1998. ; and
- [28002] Yu, R. T.; McKeown, M.; Evans, R. M.; Umesono, K. : Relationship between *Drosophila* gap gene tailless and a vertebrate nuclear receptor Tlx. *Nature* 370: 375–379, 1994.
- [28003] Further studies establishing the function and utilities of NR2E1 are found in John Hopkins OMIM database record ID 603849, and in cited publications numbered 2416–2418 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Synaptogyrin 1 (SYNGR1, Accession NM\_004711) is another VGAM689 host target gene. SYNGR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SYNGR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYNGR1 BINDING SITE, designated SEQ ID:11059, to the nucleotide

sequence of VGAM689 RNA, herein designated VGAM RNA, also designated SEQ ID:3400.

[28004] Another function of VGAM689 is therefore inhibition of Synaptogyrin 1 (SYNGR1, Accession NM\_004711), a gene which belongs to transmembrane synaptic vesicle protein and may function in membrane recycling. Accordingly, utilities of VGAM689 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYNGR1. The function of SYNGR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM107. Chromosome 12 Open Reading Frame 2 (C12orf2, Accession XM\_096040) is another VGAM689 host target gene. C12orf2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C12orf2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C12orf2 BINDING SITE, designated SEQ ID:40291, to the nucleotide sequence of VGAM689 RNA, herein designated VGAM RNA, also designated SEQ ID:3400.

[28005] Another function of VGAM689 is therefore inhibition of

Chromosome 12 Open Reading Frame 2 (C12orf2, Accession XM\_096040). Accordingly, utilities of VGAM689 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C12orf2. Chromosome 20 Open Reading Frame 21 (C20orf21, Accession NM\_017798) is another VGAM689 host target gene. C20orf21 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf21, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf21 BINDING SITE, designated SEQ ID:19441, to the nucleotide sequence of VGAM689 RNA, herein designated VGAM RNA, also designated SEQ ID:3400.

[28006] Another function of VGAM689 is therefore inhibition of Chromosome 20 Open Reading Frame 21 (C20orf21, Accession NM\_017798). Accordingly, utilities of VGAM689 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf21. MGC17330 (Accession NM\_052880) is another VGAM689 host target gene. MGC17330 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of

mRNA encoded by MGC17330, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC17330 BINDING SITE, designated SEQ ID:27459, to the nucleotide sequence of VGAM689 RNA, herein designated VGAM RNA, also designated SEQ ID:3400.

[28007] Another function of VGAM689 is therefore inhibition of MGC17330 (Accession NM\_052880). Accordingly, utilities of VGAM689 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC17330. LOC150225 (Accession XM\_097870) is another VGAM689 host target gene. LOC150225 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150225, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150225 BINDING SITE, designated SEQ ID:41193, to the nucleotide sequence of VGAM689 RNA, herein designated VGAM RNA, also designated SEQ ID:3400.

[28008] Another function of VGAM689 is therefore inhibition of LOC150225 (Accession XM\_097870). Accordingly, utilities

of VGAM689 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150225. LOC150481 (Accession XM\_086929) is another VGAM689 host target gene. LOC150481 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150481, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150481 BINDING SITE, designated SEQ ID:38982, to the nucleotide sequence of VGAM689 RNA, herein designated VGAM RNA, also designated SEQ ID:3400.

[28009] Another function of VGAM689 is therefore inhibition of LOC150481 (Accession XM\_086929). Accordingly, utilities of VGAM689 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150481. LOC152316 (Accession XM\_098185) is another VGAM689 host target gene. LOC152316 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152316, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC152316 BINDING SITE, designated SEQ ID:41455, to the nucleotide sequence of VGAM689 RNA, herein designated VGAM RNA, also designated SEQ ID:3400.

[28010] Another function of VGAM689 is therefore inhibition of LOC152316 (Accession XM\_098185). Accordingly, utilities of VGAM689 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152316. LOC158191 (Accession XM\_088505) is another VGAM689 host target gene. LOC158191 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158191, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158191 BINDING SITE, designated SEQ ID:39760, to the nucleotide sequence of VGAM689 RNA, herein designated VGAM RNA, also designated SEQ ID:3400.

[28011] Another function of VGAM689 is therefore inhibition of LOC158191 (Accession XM\_088505). Accordingly, utilities of VGAM689 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158191. LOC90072 (Accession XM\_028702) is another VGAM689 host target gene. LOC90072 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90072, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90072 BINDING SITE, designated SEQ ID:30732, to the nucleotide sequence of VGAM689 RNA, herein designated VGAM RNA, also designated SEQ ID:3400.

[28012] Another function of VGAM689 is therefore inhibition of LOC90072 (Accession XM\_028702). Accordingly, utilities of VGAM689 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90072. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 690 (VGAM690) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28013] VGAM690 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM690 was detected is described hereinabove with reference to Figs. 1-8.

[28014] VGAM690 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Coronavirus 229E. VGAM690 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28015] VGAM690 gene encodes a VGAM690 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM690 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM690 precursor RNA is designated SEQ ID:676, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:676 is located at position 5793 relative to the genome of Human Coronavirus 229E.

[28016] VGAM690 precursor RNA folds onto itself, forming VGAM690 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nu-

cleotide sequence of the second half thereof.

[28017] An enzyme complex designated DICER COMPLEX, `dices` the VGAM690 folded precursor RNA into VGAM690 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM690 RNA is designated SEQ ID:3401, and is provided hereinbelow with reference to the sequence listing part.

[28018] VGAM690 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM690 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM690 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[28019] VGAM690 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM690 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM690 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM690 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM690 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[28020] The complementary binding of VGAM690 RNA, herein designated VGAM RNA, to host target binding sites on VGAM690 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM690 host target RNA into VGAM690 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28021] It is appreciated that VGAM690 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM690 host target genes. The mRNA of each one of this plurality of VGAM690 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM690 RNA, herein designated VGAM RNA, and which when bound by VGAM690 RNA causes inhibition of translation of respective one or more VGAM690 host target proteins.

[28022] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM690 gene, herein designated VGAM GENE, on one or more VGAM690 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[28023] It is yet further appreciated that a function of VGAM690 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM690 include diagnosis, prevention and treatment of viral infection by Human Coronavirus 229E. Specific functions, and accordingly utilities, of VGAM690 correlate with, and may be deduced from, the identity of the host target genes which VGAM690 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28024] Nucleotide sequences of the VGAM690 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM690 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM690 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM690 are further described hereinbelow with reference to Table 1.

[28025] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM690 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM690 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28026] As mentioned hereinabove with reference to Fig. 1, a function of VGAM690 gene, herein designated VGAM is inhibition of expression of VGAM690 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM690 correlate with, and may be deduced from, the identity of the target genes which VGAM690 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28027] Eyes Absent Homolog 2 (Drosophila) (EYA2, Accession NM\_005244) is a VGAM690 host target gene. EYA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EYA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates

the complementarity of the nucleotide sequences of EYA2 BINDING SITE, designated SEQ ID:11752, to the nucleotide sequence of VGAM690 RNA, herein designated VGAM RNA, also designated SEQ ID:3401.

[28028] A function of VGAM690 is therefore inhibition of Eyes Absent Homolog 2 (Drosophila) (EYA2, Accession NM\_005244), a gene which may be involved in development of the eye. Accordingly, utilities of VGAM690 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EYA2. The function of EYA2 has been established by previous studies. Abdelhak et al. (1997) identified, by positional cloning, a gene at 8q13.3, which contains mutations in patients with branchiootorenal dysplasia (BOR; 113650). The gene is a human homolog of the Drosophila 'eyes absent' (eya), and was therefore called EYA1 (OMIM Ref. No. 601653). A highly conserved 271-amino acid C-terminal region was also found in the products of 2 other human genes that were subsequently called EYA2 and EYA3 (OMIM Ref. No. 601655), demonstrating the existence of a novel gene family. Some of these other members of the EYA gene family may underlie developmental defects because Abdelhak et al. (1997) demonstrated that all 3 of these

genes are expressed in the ninth week of human development. Gene identification strategies that rely on cross-species comparison are based on the observation that functionally significant regions of the genome are highly conserved during evolution. Banfi et al. (1996) applied the power of *Drosophila* genetics to the vast resource of human cDNAs represented in the expressed sequence tag (EST) database to identify novel human genes of biologic interest. One human cDNA (GenBank H07988) showing significant homology to the gene causing the *Drosophila* mutant phenotype 'clift' ('eyes absent') was reported by Abdelhak et al. (1997) to be the EYA2 gene. Banfi et al. (1996) mapped the human gene to 20q13.1 using both fluorescence in situ hybridization and radiation hybrid mapping. Zimmerman et al. (1997) mapped the mouse *Eya2* gene to chromosome 2 in a region syntenic with human 20q13. Duncan et al. (1997) likewise mapped EYA2 to human 20q13.1 and *Eya2* to mouse chromosome 2. Duncan et al. (1997) found that *Eya2* shows a dynamic pattern of expression during mouse development. Its expression was first detected in 8.5-day embryos in the region of head ectoderm fated to become the forebrain. At later stages of development, *Eya2* was expressed in the

olfactory placode and in a variety of neural crest derivatives. In the eye, expression of Eya2 was first detected after formation of the lens vesicle. At day 17.5, the highest level of Eya2 mRNA was observed in primary lens fibers. Low levels of Eya2 expression were detected in retina, sclera, and cornea. Duncan et al. (1997) stated that, although Eya2 is expressed relatively late in eye development, it belongs to a growing list of factors that may be essential for eye development among metazoan phyla. Like members of the PAX6 gene family (see OMIM Ref. No. 607108), 'eyes absent' gene family members were probably first involved in functions not related to vision, with recruitment for visual system formation and function occurring later. Xu et al. (1997) showed that in the limbs of 10.5-day mouse embryos, Eya1 expression was largely restricted to the flexor tendons, whereas Eya2 was expressed in the extensor tendons and probably also in the ligaments of the phalanges. They demonstrated that the proline/serine/threonine-rich N-terminal regions of the protein products of the Eya1, Eya2, and Eya3 genes have transcriptional activator activity. These results supported a role for the Eya genes in connective tissue patterning in the limbs.

[28029] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[28030] Abdelhak, S.; Kalatzis, V.; Heilig, R.; Compain, S.; Samson, D.; Vincent, C.; Weil, D.; Cruaud, C.; Sahly, I.; Leibovici, M.; Bitner-Glindzicz, M.; Francis, M.; Lacombe, D.; Vigneron, J.; Charachon, R.; Boven, K.; Bedbeder, P.; Van Rege-morter, N.; Weissenbach, J.; Petit, C. : A human homo-logue of the Drosophila eyes absent gene underlies bran-chio-oto-renal (BOR) syndrome and identifies a novel gene family. Nature Genet. 15: 157–164, 1997. ; and

[28031] Xu, P.-X.; Cheng, J.; Epstein, J. A.; Maas, R. L. : Mouse Eya genes are expressed during limb tendon development and encode a transcriptional activation function. Proc. Nat. Acad. Sci. 9.

[28032] Further studies establishing the function and utilities of EYA2 are found in John Hopkins OMIM database record ID 601654, and in cited publications numbered 12159–6024 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Solute Carrier Fam-ily 35 (UDP-N-acetylglucosamine (UDP-GlcNAc) Trans-porter), Member 3 (SLC35A3, Accession NM\_012243) is another VGAM690 host target gene. SLC35A3 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC35A3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC35A3 BINDING SITE, designated SEQ ID:14549, to the nucleotide sequence of VGAM690 RNA, herein designated VGAM RNA, also designated SEQ ID:3401.

[28033] Another function of VGAM690 is therefore inhibition of Solute Carrier Family 35 (UDP-N-acetylglucosamine (UDP-GlcNAc) Transporter), Member 3 (SLC35A3, Accession NM\_012243). Accordingly, utilities of VGAM690 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC35A3. FLJ32499 (Accession NM\_144607) is another VGAM690 host target gene. FLJ32499 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ32499, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ32499 BINDING SITE, designated SEQ ID:29421, to the nucleotide sequence of VGAM690 RNA, herein designated VGAM RNA, also designated SEQ

ID:3401.

[28034] Another function of VGAM690 is therefore inhibition of FLJ32499 (Accession NM\_144607). Accordingly, utilities of VGAM690 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32499. KIAA1233 (Accession XM\_032181) is another VGAM690 host target gene. KIAA1233 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1233, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1233 BINDING SITE, designated SEQ ID:31590, to the nucleotide sequence of VGAM690 RNA, herein designated VGAM RNA, also designated SEQ ID:3401.

[28035] Another function of VGAM690 is therefore inhibition of KIAA1233 (Accession XM\_032181). Accordingly, utilities of VGAM690 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1233. KIAA1910 (Accession XM\_055514) is another VGAM690 host target gene. KIAA1910 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1910, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1910 BINDING SITE, designated SEQ ID:36284, to the nucleotide sequence of VGAM690 RNA, herein designated VGAM RNA, also designated SEQ ID:3401.

[28036] Another function of VGAM690 is therefore inhibition of KIAA1910 (Accession XM\_055514). Accordingly, utilities of VGAM690 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1910. MGC19556 (Accession NM\_033551) is another VGAM690 host target gene. MGC19556 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC19556, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC19556 BINDING SITE, designated SEQ ID:27313, to the nucleotide sequence of VGAM690 RNA, herein designated VGAM RNA, also designated SEQ ID:3401.

[28037] Another function of VGAM690 is therefore inhibition of MGC19556 (Accession NM\_033551). Accordingly, utilities of VGAM690 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with MGC19556. LOC150606 (Accession XM\_097928) is another VGAM690 host target gene. LOC150606 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC150606, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150606 BINDING SITE, designated SEQ ID:41232, to the nucleotide sequence of VGAM690 RNA, herein designated VGAM RNA, also designated SEQ ID:3401.

[28038] Another function of VGAM690 is therefore inhibition of LOC150606 (Accession XM\_097928). Accordingly, utilities of VGAM690 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150606. LOC221683 (Accession XM\_168089) is another VGAM690 host target gene. LOC221683 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC221683, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221683 BINDING SITE, designated SEQ ID:45003, to

the nucleotide sequence of VGAM690 RNA, herein designated VGAM RNA, also designated SEQ ID:3401.

[28039] Another function of VGAM690 is therefore inhibition of LOC221683 (Accession XM\_168089). Accordingly, utilities of VGAM690 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221683. LOC93589 (Accession XM\_052387) is another VGAM690 host target gene. LOC93589 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC93589, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93589 BINDING SITE, designated SEQ ID:35976, to the nucleotide sequence of VGAM690 RNA, herein designated VGAM RNA, also designated SEQ ID:3401.

[28040] Another function of VGAM690 is therefore inhibition of LOC93589 (Accession XM\_052387). Accordingly, utilities of VGAM690 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93589. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 691 (VGAM691) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28041] VGAM691 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM691 was detected is described hereinabove with reference to Figs. 1–8.

[28042] VGAM691 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Coronavirus 229E. VGAM691 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28043] VGAM691 gene encodes a VGAM691 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM691 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM691 precursor RNA is designated SEQ ID:677, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:677 is located at position 13850 relative to the genome of Human Coronavirus 229E.

[28044] VGAM691 precursor RNA folds onto itself, forming VGAM691 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28045] An enzyme complex designated DICER COMPLEX, `dices` the VGAM691 folded precursor RNA into VGAM691 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM691 RNA is designated SEQ ID:3402, and is provided hereinbelow with reference to the sequence listing part.

[28046] VGAM691 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM691 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM691 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[28047] VGAM691 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM691 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM691 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM691 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM691 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[28048] The complementary binding of VGAM691 RNA, herein designated VGAM RNA, to host target binding sites on VGAM691 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM691 host target RNA into VGAM691 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28049] It is appreciated that VGAM691 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM691 host target genes. The mRNA of each one of this plurality of VGAM691 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM691 RNA, herein designated VGAM RNA, and which when bound by VGAM691 RNA causes inhibition of translation of respective one or more VGAM691 host target proteins.

[28050] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM691 gene, herein designated VGAM GENE, on one or more VGAM691 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[28051] It is yet further appreciated that a function of VGAM691 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM691 include diagnosis, prevention and treatment of viral infection by Human Coronavirus 229E. Specific functions, and accordingly utilities, of VGAM691 correlate with, and may be deduced from, the identity of

the host target genes which VGAM691 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28052] Nucleotide sequences of the VGAM691 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM691 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM691 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM691 are further described hereinbelow with reference to Table 1.

[28053] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM691 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM691 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28054] As mentioned hereinabove with reference to Fig. 1, a function of VGAM691 gene, herein designated VGAM is inhibition of expression of VGAM691 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM691 correlate with, and may be deduced from, the identity of the target genes which VGAM691

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28055] Glutamate Decarboxylase 1 (brain, 67kDa) (GAD1, Accession NM\_000817) is a VGAM691 host target gene. GAD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GAD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GAD1 BINDING SITE, designated SEQ ID:6479, to the nucleotide sequence of VGAM691 RNA, herein designated VGAM RNA, also designated SEQ ID:3402.

[28056] A function of VGAM691 is therefore inhibition of Glutamate Decarboxylase 1 (brain, 67kDa) (GAD1, Accession NM\_000817), a gene which catalyzes the conversion of glutamic acid to gamma-aminobutyric acid. Accordingly, utilities of VGAM691 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAD1. The function of GAD1 has been established by previous studies. Using a genomic probe from a human fetal brain library, Sparkes et al. (1987) probed the DNA of a mouse/human somatic cell hybrid panel and assigned the GAD gene to human chromosome 2. Kelly et al. (1992)

confirmed the assignment of GAD1 to chromosome 2, using PCR to amplify specifically the human sequence in rodent/human somatic cell hybrid DNAs. They also reported the full nucleotide sequence of the cDNA and the deduced amino acid sequence. Bu et al. (1992) mapped the GAD1 gene to 2q31 by in situ hybridization of fluorescently labeled GAD probes to human chromosomes. They demonstrated that the GAD1 gene encodes a polypeptide of 67,000 molecular weight, with 594 amino acid residues. The GAD2 gene (OMIM Ref. No. 138275), located on 10p11.23, encodes a polypeptide of 65,000 molecular weight (GAD65), with 585 amino acid residues. Brilliant et al. (1990) showed by Southern analysis of mouse-hamster hybrid cells and by interspecific backcrosses and recombinant inbred strains that the mouse equivalent (Gad1) is located on chromosome 2 and that an apparent pseudogene is located on mouse chromosome 10. The mouse Gad1 locus is part of a conserved homology between mouse chromosome 2 and human 2q. By in situ hybridization, Edelhoff et al. (1993) also assigned GAD1 to human 2q31 and to mouse chromosome 2D in a known region of conservation between human and mouse. Animal model experiments lend further support to the func-

tion of GAD1. The remaining exon–intron boundaries occur at identical positions in the 2 cDNAs, suggesting that they derive from a common ancestral GAD gene. In addition to its role as an inhibitory neurotransmitter, GABA is presumed to be involved in the development and plasticity of the nervous system. GABA is synthesized by glutamic acid decarboxylase, but the respective roles of its 2 isoforms, GAD65 and GAD67, had not been determined. Asada et al. (1996, 1997) undertook the selective elimination of each GAD isoform by gene targeting to clarify this issue. Asada et al. (1996) found that GAD65  $-/-$  mice showed no change in brain GABA content or animal behavior, except for a slight increase in susceptibility to seizures. Asada et al. (1997) produced GAD67  $-/-$  mice. These mice were born at the expected frequency but died of severe cleft palate during the first morning after birth. GAD activities and GABA contents were reduced to 20 and 7%, respectively, in the cerebral cortex of the newborn GAD67  $-/-$  mice. Their brains, however, did not show any discernible defects. Previous pharmacologic and genetic investigations suggested the involvement of GABA in palate formation, but this was the first demonstration of a role for GAD67–derived GABA in the development of non–

neural tissue. Independently, Condie et al. (1997) found defects in the formation of the palate in mice with a targeted mutation in the gene encoding GAD67. Previous observations had suggested a role of GABA in palate development. Analysis of mice with mutations in the beta-3 gamma-GABA receptor (GABRB3; 137192) had demonstrated that these mutations are associated with cleft secondary palate in mice. The phenotype in the GABRB3 mutants showed that this gene is somehow involved in palate development but did not demonstrate that GABA is the ligand involved in this particular function. The results of Condie et al. (1997), demonstrating a similar phenotype between the receptor and ligand mutations, demonstrated a role for GABA signaling in normal palate development.

[28057] It is appreciated that the abovementioned animal model for GAD1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[28058] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[28059] Asada, H.; Kawamura, Y.; Maruyama, K.; Kume, H.; Ding, R.-G.; Ji, F. Y.; Kanbara, N.; Kuzume, H.; Sanbo, M.; Yagi,

T.; Obata, K. : Mice lacking the 65 kDa isoform of glutamic acid decarboxylase (GAD65) maintain normal levels of GAD67 and GABA in their brains but are susceptible to seizures. *Biochem. Biophys. Res. Commun.* 229: 891–895, 1996. ; and

[28061] Further studies establishing the function and utilities of GAD1 are found in John Hopkins OMIM database record ID 605363, and in cited publications numbered 11924–6634, 11925–6636, 11926–6639, 1241–124 and 6640 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.FLJ22028 (Accession NM\_024854) is another VGAM691 host target gene. FLJ22028 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ22028, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22028 BINDING SITE, designated SEQ ID:24284, to the nucleotide sequence of VGAM691 RNA, herein designated VGAM RNA, also designated SEQ

ID:3402.

- [28062] Another function of VGAM691 is therefore inhibition of FLJ22028 (Accession NM\_024854). Accordingly, utilities of VGAM691 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22028. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 692 (VGAM692) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.
- [28063] VGAM692 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM692 was detected is described hereinabove with reference to Figs. 1–8.
- [28064] VGAM692 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Coronavirus 229E. VGAM692 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.
- [28065] VGAM692 gene encodes a VGAM692 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM692

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM692 precursor RNA is designated SEQ ID:678, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:678 is located at position 6444 relative to the genome of Human Coronavirus 229E.

[28066] VGAM692 precursor RNA folds onto itself, forming VGAM692 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28067] An enzyme complex designated DICER COMPLEX, `dices` the VGAM692 folded precursor RNA into VGAM692 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 40%) nucleotide sequence of VGAM692 RNA is designated SEQ ID:3403, and is provided hereinbelow with reference to the sequence listing part.

[28068] VGAM692 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM692 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM692 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[28069] VGAM692 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM692 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM692 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM692 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM692 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[28070] The complementary binding of VGAM692 RNA, herein designated VGAM RNA, to host target binding sites on VGAM692 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM692 host target RNA into VGAM692 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28071] It is appreciated that VGAM692 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM692 host target genes. The mRNA of each one of this plurality of VGAM692 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM692 RNA, herein designated VGAM RNA, and which when bound by VGAM692 RNA causes inhibition of translation of respective one or more VGAM692 host target proteins.

[28072] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM692 gene, herein designated VGAM GENE, on one or more VGAM692 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[28073] It is yet further appreciated that a function of VGAM692 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM692 include diagnosis, prevention and treatment of viral infection by Human Coronavirus 229E. Specific functions, and accordingly utilities, of VGAM692 correlate with, and may be deduced from, the identity of the host target genes which VGAM692 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28074] Nucleotide sequences of the VGAM692 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM692 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM692 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM692 are further described hereinbelow with reference to Table 1.

[28075] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM692 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM692 RNA, herein designated VGAM RNA, are described hereinbelow with refer-

ence to Table 2.

[28076] As mentioned hereinabove with reference to Fig. 1, a function of VGAM692 gene, herein designated VGAM is inhibition of expression of VGAM692 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM692 correlate with, and may be deduced from, the identity of the target genes which VGAM692 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28077] CGI-142 (Accession NM\_016073) is a VGAM692 host target gene. CGI-142 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CGI-142, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CGI-142 BINDING SITE, designated SEQ ID:18145, to the nucleotide sequence of VGAM692 RNA, herein designated VGAM RNA, also designated SEQ ID:3403.

[28078] A function of VGAM692 is therefore inhibition of CGI-142 (Accession NM\_016073). Accordingly, utilities of VGAM692 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CGI-142.

FLJ10701 (Accession NM\_018183) is another VGAM692 host target gene. FLJ10701 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10701, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10701 BINDING SITE, designated SEQ ID:20022, to the nucleotide sequence of VGAM692 RNA, herein designated VGAM RNA, also designated SEQ ID:3403.

[28079] Another function of VGAM692 is therefore inhibition of FLJ10701 (Accession NM\_018183). Accordingly, utilities of VGAM692 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10701. KIAA1363 (Accession XM\_045056) is another VGAM692 host target gene. KIAA1363 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1363, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1363 BINDING SITE, designated SEQ ID:34331, to the nucleotide sequence of VGAM692 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:3403.

[28080] Another function of VGAM692 is therefore inhibition of KIAA1363 (Accession XM\_045056). Accordingly, utilities of VGAM692 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1363. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 693 (VGAM693) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28081] VGAM693 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM693 was detected is described hereinabove with reference to Figs. 1–8.

[28082] VGAM693 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Coronavirus 229E. VGAM693 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28083] VGAM693 gene encodes a VGAM693 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM693 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM693 precursor RNA is designated SEQ ID:679, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:679 is located at position 4759 relative to the genome of Human Coronavirus 229E.

[28084] VGAM693 precursor RNA folds onto itself, forming VGAM693 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28085] An enzyme complex designated DICER COMPLEX, `dices` the VGAM693 folded precursor RNA into VGAM693 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 58%) nucleotide sequence of VGAM693 RNA is designated SEQ ID:3404, and is provided hereinbelow with reference to the sequence listing part.

[28086] VGAM693 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM693 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM693 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[28087] VGAM693 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM693 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM693 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM693 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM693 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[28088] The complementary binding of VGAM693 RNA, herein designated VGAM RNA, to host target binding sites on VGAM693 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM693 host target RNA into VGAM693 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28089] It is appreciated that VGAM693 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM693 host target genes. The mRNA of

each one of this plurality of VGAM693 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM693 RNA, herein designated VGAM RNA, and which when bound by VGAM693 RNA causes inhibition of translation of respective one or more VGAM693 host target proteins.

[28090] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM693 gene, herein designated VGAM GENE, on one or more VGAM693 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[28091] It is yet further appreciated that a function of VGAM693 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM693 include diagnosis, prevention and treatment of viral infection by Human Coronavirus 229E. Specific functions, and accordingly utilities, of VGAM693 correlate with, and may be deduced from, the identity of the host target genes which VGAM693 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28092] Nucleotide sequences of the VGAM693 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM693 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM693 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM693 are further described hereinbelow with reference to Table 1.

[28093] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM693 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM693 RNA, herein desig-

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[28094] As mentioned hereinabove with reference to Fig. 1, a function of VGAM693 gene, herein designated VGAM is inhibition of expression of VGAM693 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM693 correlate with, and may be deduced from, the identity of the target genes which VGAM693 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28095] Contactin Associated Protein-like 2 (CNTNAP2, Accession NM\_014141) is a VGAM693 host target gene. CNTNAP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CNTNAP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNTNAP2 BINDING SITE, designated SEQ ID:15423, to the nucleotide sequence of VGAM693 RNA, herein designated VGAM RNA, also designated SEQ ID:3404.

[28096] A function of VGAM693 is therefore inhibition of Contactin Associated Protein-like 2 (CNTNAP2, Accession

NM\_014141). Accordingly, utilities of VGAM693 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNTNAP2. Protocadherin Beta 12 (PCDHB12, Accession NM\_018932) is another VGAM693 host target gene. PCDHB12 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHB12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHB12 BINDING SITE, designated SEQ ID:21003, to the nucleotide sequence of VGAM693 RNA, herein designated VGAM RNA, also designated SEQ ID:3404.

[28097] Another function of VGAM693 is therefore inhibition of Protocadherin Beta 12 (PCDHB12, Accession NM\_018932). Accordingly, utilities of VGAM693 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHB12. Protocadherin Beta 7 (PCDHB7, Accession NM\_018940) is another VGAM693 host target gene. PCDHB7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHB7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of PCDHB7 BINDING SITE, designated SEQ ID:21009, to the nucleotide sequence of VGAM693 RNA, herein designated VGAM RNA, also designated SEQ ID:3404.

[28098] Another function of VGAM693 is therefore inhibition of Protocadherin Beta 7 (PCDHB7, Accession NM\_018940). Accordingly, utilities of VGAM693 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHB7. FLJ21302 (Accession NM\_022901) is another VGAM693 host target gene. FLJ21302 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21302, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21302 BINDING SITE, designated SEQ ID:23185, to the nucleotide sequence of VGAM693 RNA, herein designated VGAM RNA, also designated SEQ ID:3404.

[28099] Another function of VGAM693 is therefore inhibition of FLJ21302 (Accession NM\_022901). Accordingly, utilities of VGAM693 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FLJ21302. FLJ22557 (Accession NM\_024713) is another VGAM693 host target gene. FLJ22557 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22557, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22557 BINDING SITE, designated SEQ ID:24039, to the nucleotide sequence of VGAM693 RNA, herein designated VGAM RNA, also designated SEQ ID:3404.

[28100] Another function of VGAM693 is therefore inhibition of FLJ22557 (Accession NM\_024713). Accordingly, utilities of VGAM693 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22557. KIAA1228 (Accession XM\_036408) is another VGAM693 host target gene. KIAA1228 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1228, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1228 BINDING SITE, designated SEQ ID:32448, to the nucleotide sequence of

VGAM693 RNA, herein designated VGAM RNA, also designated SEQ ID:3404.

[28101] Another function of VGAM693 is therefore inhibition of KIAA1228 (Accession XM\_036408). Accordingly, utilities of VGAM693 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1228. Protocadherin 10 (PCDH10, Accession NM\_032961) is another VGAM693 host target gene. PCDH10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDH10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDH10 BINDING SITE, designated SEQ ID:26772, to the nucleotide sequence of VGAM693 RNA, herein designated VGAM RNA, also designated SEQ ID:3404.

[28102] Another function of VGAM693 is therefore inhibition of Protocadherin 10 (PCDH10, Accession NM\_032961). Accordingly, utilities of VGAM693 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH10. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral

gene of the present invention, referred to here as Viral Genomic Address Messenger 694 (VGAM694) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28103] VGAM694 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM694 was detected is described hereinabove with reference to Figs. 1–8.

[28104] VGAM694 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Coronavirus 229E. VGAM694 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28105] VGAM694 gene encodes a VGAM694 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM694 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM694 precursor RNA is designated SEQ ID:680, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:680 is located at position 9591 relative to the genome of Human

Coronavirus 229E.

[28106] VGAM694 precursor RNA folds onto itself, forming VGAM694 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28107] An enzyme complex designated DICER COMPLEX, `dices` the VGAM694 folded precursor RNA into VGAM694 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM694 RNA is designated SEQ ID:3405, and is provided hereinbelow with reference to the sequence listing part.

[28108] VGAM694 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM694 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM694 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[28109] VGAM694 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM694 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM694 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM694 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM694 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[28110] The complementary binding of VGAM694 RNA, herein designated VGAM RNA, to host target binding sites on VGAM694 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM694 host target RNA into VGAM694 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28111] It is appreciated that VGAM694 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM694 host target genes. The mRNA of each one of this plurality of VGAM694 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM694 RNA, herein designated VGAM RNA, and which when bound by VGAM694 RNA causes inhibition of translation of respective one or more VGAM694 host target proteins.

[28112] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM694 gene, herein designated VGAM GENE, on one or more VGAM694 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[28113] It is yet further appreciated that a function of VGAM694 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM694 include diagnosis, prevention and treatment of viral infection by Human Coronavirus 229E. Specific functions, and accordingly utilities, of VGAM694

correlate with, and may be deduced from, the identity of the host target genes which VGAM694 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28114] Nucleotide sequences of the VGAM694 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM694 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM694 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM694 are further described hereinbelow with reference to Table 1.

[28115] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM694 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM694 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28116] As mentioned hereinabove with reference to Fig. 1, a function of VGAM694 gene, herein designated VGAM is inhibition of expression of VGAM694 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM694 correlate with, and may be deduced

from, the identity of the target genes which VGAM694 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28117] Adenylate Cyclase 7 (ADCY7, Accession NM\_001114) is a VGAM694 host target gene. ADCY7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADCY7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADCY7 BINDING SITE, designated SEQ ID:6780, to the nucleotide sequence of VGAM694 RNA, herein designated VGAM RNA, also designated SEQ ID:3405.

[28118] A function of VGAM694 is therefore inhibition of Adenylate Cyclase 7 (ADCY7, Accession NM\_001114), a gene which is a membrane-bound,  $\text{Ca}^{2+}$ -inhibitable adenylyl cyclase. Accordingly, utilities of VGAM694 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADCY7. The function of ADCY7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM108.EGF-like-domain, Multiple 4 (EGFL4, Accession

XM\_029883) is another VGAM694 host target gene. EGFL4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EGFL4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGFL4 BINDING SITE, designated SEQ ID:30963, to the nucleotide sequence of VGAM694 RNA, herein designated VGAM RNA, also designated SEQ ID:3405.

[28119] Another function of VGAM694 is therefore inhibition of EGF-like-domain, Multiple 4 (EGFL4, Accession XM\_029883). Accordingly, utilities of VGAM694 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGFL4. Glutaminase (GLS, Accession NM\_014905) is another VGAM694 host target gene. GLS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GLS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GLS BINDING SITE, designated SEQ ID:17105, to the nucleotide sequence of VGAM694 RNA, herein designated VGAM RNA, also designated SEQ ID:3405.

[28120] Another function of VGAM694 is therefore inhibition of Glutaminase (GLS, Accession NM\_014905). Accordingly, utilities of VGAM694 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GLS. Vanin 1 (VNN1, Accession NM\_004666) is another VGAM694 host target gene. VNN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VNN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VNN1 BINDING SITE, designated SEQ ID:11038, to the nucleotide sequence of VGAM694 RNA, herein designated VGAM RNA, also designated SEQ ID:3405.

[28121] Another function of VGAM694 is therefore inhibition of Vanin 1 (VNN1, Accession NM\_004666), a gene which may regulate steps in thymus homing and play a role in mammalian sexual development. Accordingly, utilities of VGAM694 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VNN1. The function of VNN1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to VGAM419.LOC56920 (Accession NM\_020163) is another VGAM694 host target gene. LOC56920 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC56920, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC56920 BINDING SITE, designated SEQ ID:21380, to the nucleotide sequence of VGAM694 RNA, herein designated VGAM RNA, also designated SEQ ID:3405.

[28122] Another function of VGAM694 is therefore inhibition of LOC56920 (Accession NM\_020163). Accordingly, utilities of VGAM694 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC56920. LOC93463 (Accession XM\_051528) is another VGAM694 host target gene. LOC93463 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC93463, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93463 BINDING SITE, designated SEQ ID:35850, to the nucleotide sequence of VGAM694 RNA, herein designated

VGAM RNA, also designated SEQ ID:3405.

[28123] Another function of VGAM694 is therefore inhibition of LOC93463 (Accession XM\_051528). Accordingly, utilities of VGAM694 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93463. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 695 (VGAM695) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28124] VGAM695 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM695 was detected is described hereinabove with reference to Figs. 1–8.

[28125] VGAM695 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Coronavirus 229E. VGAM695 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28126] VGAM695 gene encodes a VGAM695 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM695 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM695 precursor RNA is designated SEQ ID:681, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:681 is located at position 2788 relative to the genome of Human Coronavirus 229E.

[28127] VGAM695 precursor RNA folds onto itself, forming VGAM695 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28128] An enzyme complex designated DICER COMPLEX, `dices` the VGAM695 folded precursor RNA into VGAM695 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 51%) nucleotide sequence of VGAM695 RNA is designated SEQ ID:3406, and is provided hereinbelow with reference to the sequence listing part.

[28129] VGAM695 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM695 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM695 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[28130] VGAM695 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM695 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM695 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM695 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM695 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[28131] The complementary binding of VGAM695 RNA, herein designated VGAM RNA, to host target binding sites on VGAM695 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM695 host target RNA into VGAM695 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28132] It is appreciated that VGAM695 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM695 host target genes. The mRNA of

each one of this plurality of VGAM695 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM695 RNA, herein designated VGAM RNA, and which when bound by VGAM695 RNA causes inhibition of translation of respective one or more VGAM695 host target proteins.

[28133] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM695 gene, herein designated VGAM GENE, on one or more VGAM695 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[28134] It is yet further appreciated that a function of VGAM695 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM695 include diagnosis, prevention and treatment of viral infection by Human Coronavirus 229E. Specific functions, and accordingly utilities, of VGAM695 correlate with, and may be deduced from, the identity of the host target genes which VGAM695 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28135] Nucleotide sequences of the VGAM695 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM695 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM695 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM695 are further described hereinbelow with reference to Table 1.

[28136] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM695 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM695 RNA, herein desig-

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[28137] As mentioned hereinabove with reference to Fig. 1, a function of VGAM695 gene, herein designated VGAM is inhibition of expression of VGAM695 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM695 correlate with, and may be deduced from, the identity of the target genes which VGAM695 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28138] Estrogen Receptor 1 (ESR1, Accession NM\_000125) is a VGAM695 host target gene. ESR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ESR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ESR1 BINDING SITE, designated SEQ ID:5602, to the nucleotide sequence of VGAM695 RNA, herein designated VGAM RNA, also designated SEQ ID:3406.

[28139] A function of VGAM695 is therefore inhibition of Estrogen Receptor 1 (ESR1, Accession NM\_000125), a gene which involved in hormone-mediated inhibition of gene expres-

sion. Accordingly, utilities of VGAM695 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ESR1. The function of ESR1 has been established by previous studies. The estrogen receptor (ESR) is a ligand-activated transcription factor composed of several domains important for hormone binding, DNA binding, and activation of transcription. Walter et al. (1985) cloned and Greene et al. (1986) sequenced a cDNA for the entire translated portion of the messenger RNA for the estrogen receptor of MCF-7 human breast cancer cells. Expression with production of a functional protein was accomplished in Chinese hamster ovary cells. The 1,785 nucleotides of the cDNA correspond to a polypeptide of 595 amino acids and a molecular weight of 66,200 (about that estimated from other studies of the estrogen receptor). Amino acid sequence comparisons showed considerable similarities between human ESR, human GCR (OMIM Ref. No. 138040), and the putative v-erbA (OMIM Ref. No. 190120) oncogene product. Both ESR and GCR exert their effects by binding directly to an intranuclear receptor molecule that is weakly associated with nuclear components in the absence of ligand. Binding of hormone to its receptor results in conversion of the receptor-

steroid complex to a form that binds with high affinity to nuclear components. Green et al. (1986) also cloned and sequenced human estrogen receptor cDNA, using the breast cancer cell line MCF-7. They found extensive homology between ESR cDNA and the ERBA oncogene.

Chaidarun and Alexander (1998) examined the effects of a human ESR1 isoform on estrogen-mediated gene activation in U2-OS osteosarcoma cells. ESR1-5, an ESR1 variant generated by an alternate splice event that omits exon 5 and alters the reading frame of the resulting mRNA, was coexpressed with normal ESR1 in several estrogen-responsive neoplastic tissues. ESR1-5 encodes the hormone-independent trans-activating function (AF-1), as well as the constitutive receptor dimerization and DNA-binding domains. The ESR1-5 protein is prematurely truncated and lacks the majority of the hormone-binding and activating function-2 (AF-2) domains. When ESR1-5 was cotransfected with normal ESR1, both basal and estrogen-stimulated reporter activation were increased approximately 500% over the levels observed when cells were transfected with ESR1 alone. Electromobility shift/supershift assays using nuclear extracts of U2-OS cells stably transfected with ESR1 and ESR1-5 confirmed the

constitutive binding of ESR1-5 and ESR1 protein to the estrogen-response element (ERE) sequence independent of estrogen, and also showed an increase in ESR1-5/ESR1-ERE complexes with estrogen treatment. These data were considered to be consistent with the interactive effects of normal ESR1 and ESR1-5 on transcription from classic ERE gene promoters. Chaidarun and Alexander (1998) concluded that ESR1-5 acts as a dominant-positive receptor that increases both basal and estrogen-stimulated gene transactivation of normal ESR1. Walter et al. (1985) determined that the human ESR gene maps to chromosome 6. By in situ hybridization, using a cDNA probe containing the coding sequence for the estrogen receptor, Gosden et al. (1986) assigned the gene to 6q24-q27. To localize ESR more precisely, Menasce et al. (1993) isolated a YAC containing the gene and mapped it to 6q25.1 by fluorescence in situ hybridization (FISH) and a new simple method of post-FISH chromosome banding. Using a single interspecific backcross, Justice et al. (1990) demonstrated the genetic location of the *Esr* gene in relation to other loci on mouse chromosome 10. Animal model experiments lend further support to the function of ESR1. Davis et al. (2002) noted that studies in humans and

rodent models had suggested that estrogen may provide protection against age-related cataracts. The presence of estrogen receptors in the eye indicates that estrogen protection may result from direct interactions with its receptors in the eye, instead of being an indirect consequence from effects on another tissue. Davis et al. (2002) validated the concept that estrogen is beneficial for the eye. In transgenic mice expressing ER-delta-3, a natural variant of ESR1 with an in-frame deletion of exon 3 resulting from alternative splicing, they found that cortical cataracts spontaneously formed in females after puberty and progressed with age.

[28140] It is appreciated that the abovementioned animal model for ESR1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[28141] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[28142] Greene, G. L.; Gilna, P.; Waterfield, M.; Baker, A.; Hort, Y.; Shine, J. : Sequence and expression of human estrogen receptor complementary DNA. Science 231: 1150-1154, 1986. ; and

[28143] Davis, V. L.; Chan, C.-C.; Schoen, T. J.; Couse, J. F.; Chader, G. J.; Korach, K. S. : An estrogen receptor repressor induces cataract formation in transgenic mice. Proc. Nat. Acad. Sci.

[28144] Further studies establishing the function and utilities of ESR1 are found in John Hopkins OMIM database record ID 133430, and in cited publications numbered 2132–2152, 877, 3104–313 and 3444–3446 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Potassium Channel, Subfamily K, Member 4 (KCNK4, Accession NM\_016611) is another VGAM695 host target gene. KCNK4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KCNK4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNK4 BINDING SITE, designated SEQ ID:18717, to the nucleotide sequence of VGAM695 RNA, herein designated VGAM RNA, also designated SEQ ID:3406.

[28145] Another function of VGAM695 is therefore inhibition of Potassium Channel, Subfamily K, Member 4 (KCNK4, Accession NM\_016611). Accordingly, utilities of VGAM695

include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNK4. Neogenin Homolog 1 (chicken) (NEO1, Accession NM\_002499) is another VGAM695 host target gene. NEO1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NEO1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NEO1 BINDING SITE, designated SEQ ID:8319, to the nucleotide sequence of VGAM695 RNA, herein designated VGAM RNA, also designated SEQ ID:3406.

[28146] Another function of VGAM695 is therefore inhibition of Neogenin Homolog 1 (chicken) (NEO1, Accession NM\_002499), a gene which regulates the transition of undifferentiated proliferating cells to their differentiated state. Accordingly, utilities of VGAM695 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEO1. The function of NEO1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM329.HDAC9-PENDING (Accession NM\_014707) is another VGAM695 host target

gene. HDAC9–PENDING BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HDAC9–PENDING, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HDAC9–PENDING BINDING SITE, designated SEQ ID:16252, to the nucleotide sequence of VGAM695 RNA, herein designated VGAM RNA, also designated SEQ ID:3406.

[28147] Another function of VGAM695 is therefore inhibition of HDAC9–PENDING (Accession NM\_014707). Accordingly, utilities of VGAM695 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HDAC9–PENDING. KIAA1634 (Accession XM\_032749) is another VGAM695 host target gene. KIAA1634 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1634, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1634 BINDING SITE, designated SEQ ID:31754, to the nucleotide sequence of VGAM695 RNA, herein designated VGAM RNA, also designated SEQ ID:3406.

[28148] Another function of VGAM695 is therefore inhibition of KIAA1634 (Accession XM\_032749). Accordingly, utilities of VGAM695 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1634. Tumor Protein P53 Inducible Nuclear Protein 1 (TP53INP1, Accession XM\_053740) is another VGAM695 host target gene. TP53INP1 BINDING SITE1 and TP53INP1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TP53INP1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TP53INP1 BINDING SITE1 and TP53INP1 BINDING SITE2, designated SEQ ID:36120 and SEQ ID:27111 respectively, to the nucleotide sequence of VGAM695 RNA, herein designated VGAM RNA, also designated SEQ ID:3406.

[28149] Another function of VGAM695 is therefore inhibition of Tumor Protein P53 Inducible Nuclear Protein 1 (TP53INP1, Accession XM\_053740). Accordingly, utilities of VGAM695 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TP53INP1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention,

referred to here as Viral Genomic Address Messenger 696 (VGAM696) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28150] VGAM696 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM696 was detected is described hereinabove with reference to Figs. 1–8.

[28151] VGAM696 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Coronavirus 229E. VGAM696 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28152] VGAM696 gene encodes a VGAM696 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM696 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM696 precursor RNA is designated SEQ ID:682, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:682 is located at position 13163 relative to the genome of Human Coronavirus 229E.

[28153] VGAM696 precursor RNA folds onto itself, forming VGAM696 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28154] An enzyme complex designated DICER COMPLEX, `dices` the VGAM696 folded precursor RNA into VGAM696 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM696 RNA is designated SEQ ID:3407, and is provided hereinbelow with reference to the sequence listing part.

[28155] VGAM696 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM696 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM696 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[28156] VGAM696 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM696 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM696 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM696 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM696 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[28157] The complementary binding of VGAM696 RNA, herein designated VGAM RNA, to host target binding sites on VGAM696 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM696 host target RNA into VGAM696 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28158] It is appreciated that VGAM696 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM696 host target genes. The mRNA of each one of this plurality of VGAM696 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM696 RNA, herein designated VGAM RNA, and which when bound by VGAM696 RNA causes inhibition of translation of respective one or more VGAM696 host target proteins.

[28159] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM696 gene, herein designated VGAM GENE, on one or more VGAM696 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[28160] It is yet further appreciated that a function of VGAM696 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM696 include diagnosis, prevention and treatment of viral infection by Human Coronavirus 229E. Specific functions, and accordingly utilities, of VGAM696 correlate with, and may be deduced from, the identity of

the host target genes which VGAM696 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28161] Nucleotide sequences of the VGAM696 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM696 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM696 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM696 are further described hereinbelow with reference to Table 1.

[28162] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM696 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM696 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28163] As mentioned hereinabove with reference to Fig. 1, a function of VGAM696 gene, herein designated VGAM is inhibition of expression of VGAM696 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM696 correlate with, and may be deduced from, the identity of the target genes which VGAM696

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28164] CGTHBA (Accession NM\_012075) is a VGAM696 host target gene. CGTHBA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CGTHBA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CGTHBA BINDING SITE, designated SEQ ID:14361, to the nucleotide sequence of VGAM696 RNA, herein designated VGAM RNA, also designated SEQ ID:3407.

[28165] A function of VGAM696 is therefore inhibition of CGTHBA (Accession NM\_012075). Accordingly, utilities of VGAM696 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CGTHBA. SORCS2 (Accession NM\_020777) is another VGAM696 host target gene. SORCS2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SORCS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SORCS2 BINDING SITE,

designated SEQ ID:21871, to the nucleotide sequence of VGAM696 RNA, herein designated VGAM RNA, also designated SEQ ID:3407.

[28166] Another function of VGAM696 is therefore inhibition of SORCS2 (Accession NM\_020777). Accordingly, utilities of VGAM696 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SORCS2. Carbohydrate (chondroitin 6) Sulfotransferase 3 (CHST3, Accession NM\_004273) is another VGAM696 host target gene. CHST3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CHST3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHST3 BINDING SITE, designated SEQ ID:10478, to the nucleotide sequence of VGAM696 RNA, herein designated VGAM RNA, also designated SEQ ID:3407.

[28167] Another function of VGAM696 is therefore inhibition of Carbohydrate (chondroitin 6) Sulfotransferase 3 (CHST3, Accession NM\_004273). Accordingly, utilities of VGAM696 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHST3. KIAA0205

(Accession NM\_014873) is another VGAM696 host target gene. KIAA0205 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0205, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0205 BINDING SITE, designated SEQ ID:17004, to the nucleotide sequence of VGAM696 RNA, herein designated VGAM RNA, also designated SEQ ID:3407.

[28168] Another function of VGAM696 is therefore inhibition of KIAA0205 (Accession NM\_014873). Accordingly, utilities of VGAM696 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0205. MIG-6 (Accession NM\_018948) is another VGAM696 host target gene. MIG-6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MIG-6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MIG-6 BINDING SITE, designated SEQ ID:21019, to the nucleotide sequence of VGAM696 RNA, herein designated VGAM RNA, also design-

nated SEQ ID:3407.

[28169] Another function of VGAM696 is therefore inhibition of MIG-6 (Accession NM\_018948). Accordingly, utilities of VGAM696 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MIG-6. STAF65(gamma) (Accession NM\_014860) is another VGAM696 host target gene. STAF65(gamma) BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STAF65(gamma), corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STAF65(gamma) BINDING SITE, designated SEQ ID:16921, to the nucleotide sequence of VGAM696 RNA, herein designated VGAM RNA, also designated SEQ ID:3407.

[28170] Another function of VGAM696 is therefore inhibition of STAF65(gamma) (Accession NM\_014860). Accordingly, utilities of VGAM696 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STAF65(gamma). LOC201685 (Accession XM\_117325) is another VGAM696 host target gene. LOC201685 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by

LOC201685, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201685 BINDING SITE, designated SEQ ID:43387, to the nucleotide sequence of VGAM696 RNA, herein designated VGAM RNA, also designated SEQ ID:3407.

[28171] Another function of VGAM696 is therefore inhibition of LOC201685 (Accession XM\_117325). Accordingly, utilities of VGAM696 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201685. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 697 (VGAM697) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28172] VGAM697 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM697 was detected is described hereinabove with reference to Figs. 1-8.

[28173] VGAM697 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Human Coronavirus 229E. VGAM697 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28174] VGAM697 gene encodes a VGAM697 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM697 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM697 precursor RNA is designated SEQ ID:683, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:683 is located at position 2149 relative to the genome of Human Coronavirus 229E.

[28175] VGAM697 precursor RNA folds onto itself, forming VGAM697 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28176] An enzyme complex designated DICER COMPLEX, `dices` the VGAM697 folded precursor RNA into VGAM697 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 68%) nucleotide sequence of VGAM697 RNA is designated SEQ ID:3408, and is provided hereinbelow with reference to the sequence listing part.

[28177] VGAM697 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM697 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM697 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[28178] VGAM697 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM697 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM697 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM697 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM697 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[28179] The complementary binding of VGAM697 RNA, herein designated VGAM RNA, to host target binding sites on VGAM697 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM697 host tar-

get RNA into VGAM697 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28180] It is appreciated that VGAM697 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM697 host target genes. The mRNA of each one of this plurality of VGAM697 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM697 RNA, herein designated VGAM RNA, and which when bound by VGAM697 RNA causes inhibition of translation of respective one or more VGAM697 host target proteins.

[28181] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM697 gene, herein designated VGAM GENE, on one or more VGAM697 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[28182] It is yet further appreciated that a function of VGAM697 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM697 include diagnosis, prevention and treatment of viral infection by Human Coronavirus 229E. Specific functions, and accordingly utilities, of VGAM697 correlate with, and may be deduced from, the identity of the host target genes which VGAM697 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28183] Nucleotide sequences of the VGAM697 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM697 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM697 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM697 are further

described hereinbelow with reference to Table 1.

[28184] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM697 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM697 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28185] As mentioned hereinabove with reference to Fig. 1, a function of VGAM697 gene, herein designated VGAM is inhibition of expression of VGAM697 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM697 correlate with, and may be deduced from, the identity of the target genes which VGAM697 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28186] Epithelial Membrane Protein 1 (EMP1, Accession NM\_001423) is a VGAM697 host target gene. EMP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EMP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EMP1

BINDING SITE, designated SEQ ID:7135, to the nucleotide sequence of VGAM697 RNA, herein designated VGAM RNA, also designated SEQ ID:3408.

[28187] A function of VGAM697 is therefore inhibition of Epithelial Membrane Protein 1 (EMP1, Accession NM\_001423), a gene which plays a role in squamous cell differentiation; member of the PMP22/EMP/MP20 family of membrane glycoproteins. Accordingly, utilities of VGAM697 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EMP1. The function of EMP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM107. McKusick-Kaufman Syndrome (MKKS, Accession NM\_018848) is another VGAM697 host target gene. MKKS BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MKKS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MKKS BINDING SITE, designated SEQ ID:20833, to the nucleotide sequence of VGAM697 RNA, herein designated VGAM RNA, also designated SEQ ID:3408.

[28188] Another function of VGAM697 is therefore inhibition of McKusick–Kaufman Syndrome (MKKS, Accession NM\_018848). Accordingly, utilities of VGAM697 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MKKS. Protocadherin Alpha 9 (PCDHA9, Accession NM\_014005) is another VGAM697 host target gene. PCDHA9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHA9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA9 BINDING SITE, designated SEQ ID:15211, to the nucleotide sequence of VGAM697 RNA, herein designated VGAM RNA, also designated SEQ ID:3408.

[28189] Another function of VGAM697 is therefore inhibition of Protocadherin Alpha 9 (PCDHA9, Accession NM\_014005), a gene which is a calcium–dependent cell–adhesion protein. Accordingly, utilities of VGAM697 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA9. The function of PCDHA9 and its association with various diseases and clinical conditions, has been established by previous studies, as de–

scribed hereinabove with reference to VGAM71. Tripartite Motif-containing 9 (TRIM9, Accession NM\_015163) is another VGAM697 host target gene. TRIM9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRIM9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM9 BINDING SITE, designated SEQ ID:17512, to the nucleotide sequence of VGAM697 RNA, herein designated VGAM RNA, also designated SEQ ID:3408.

[28190] Another function of VGAM697 is therefore inhibition of Tripartite Motif-containing 9 (TRIM9, Accession NM\_015163), a gene which may function as a positive regulator for mannosylphosphate transferase and is required to mediate mannosylphosphate transfer in both the core and outer chain portions of n-linked oligosaccharides. Accordingly, utilities of VGAM697 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM9. The function of TRIM9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74. F-box

Only Protein 21 (FBXO21, Accession NM\_033624) is another VGAM697 host target gene. FBXO21 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FBXO21, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBXO21 BINDING SITE, designated SEQ ID:27320, to the nucleotide sequence of VGAM697 RNA, herein designated VGAM RNA, also designated SEQ ID:3408.

[28191] Another function of VGAM697 is therefore inhibition of F-box Only Protein 21 (FBXO21, Accession NM\_033624). Accordingly, utilities of VGAM697 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXO21. KIAA0721 (Accession XM\_171125) is another VGAM697 host target gene. KIAA0721 BINDING SITE1 and KIAA0721 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA0721, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0721 BINDING SITE1 and KIAA0721 BINDING SITE2, designated SEQ ID:45927

and SEQ ID:22320 respectively, to the nucleotide sequence of VGAM697 RNA, herein designated VGAM RNA, also designated SEQ ID:3408.

[28192] Another function of VGAM697 is therefore inhibition of KIAA0721 (Accession XM\_171125). Accordingly, utilities of VGAM697 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0721. LOC157798 (Accession XM\_098827) is another VGAM697 host target gene. LOC157798 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157798, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157798 BINDING SITE, designated SEQ ID:41849, to the nucleotide sequence of VGAM697 RNA, herein designated VGAM RNA, also designated SEQ ID:3408.

[28193] Another function of VGAM697 is therefore inhibition of LOC157798 (Accession XM\_098827). Accordingly, utilities of VGAM697 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157798. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 698 (VGAM698) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28194] VGAM698 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM698 was detected is described hereinabove with reference to Figs. 1–8.

[28195] VGAM698 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Coronavirus 229E. VGAM698 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28196] VGAM698 gene encodes a VGAM698 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM698 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM698 precursor RNA is designated SEQ ID:684, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:684 is located at position 16358 relative to the genome of Hu–

man Coronavirus 229E.

[28197] VGAM698 precursor RNA folds onto itself, forming VGAM698 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28198] An enzyme complex designated DICER COMPLEX, `dices` the VGAM698 folded precursor RNA into VGAM698 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM698 RNA is designated SEQ ID:3409, and is provided hereinbelow with reference to the sequence listing part.

[28199] VGAM698 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM698 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM698 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[28200] VGAM698 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM698 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM698 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM698 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM698 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[28201] The complementary binding of VGAM698 RNA, herein designated VGAM RNA, to host target binding sites on VGAM698 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM698 host target RNA into VGAM698 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28202] It is appreciated that VGAM698 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM698 host target genes. The mRNA of each one of this plurality of VGAM698 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM698 RNA, herein designated VGAM RNA, and which when bound by VGAM698 RNA causes inhibition of translation of respective one or more VGAM698 host target proteins.

[28203] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM698 gene, herein designated VGAM GENE, on one or more VGAM698 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[28204] It is yet further appreciated that a function of VGAM698 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM698 include diagnosis, prevention and treatment of viral infection by Human Coronavirus 229E. Specific functions, and accordingly utilities, of VGAM698

correlate with, and may be deduced from, the identity of the host target genes which VGAM698 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28205] Nucleotide sequences of the VGAM698 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM698 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM698 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM698 are further described hereinbelow with reference to Table 1.

[28206] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM698 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM698 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28207] As mentioned hereinabove with reference to Fig. 1, a function of VGAM698 gene, herein designated VGAM is inhibition of expression of VGAM698 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM698 correlate with, and may be deduced

from, the identity of the target genes which VGAM698 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28208] DKFZp547M072 (Accession XM\_028067) is a VGAM698 host target gene. DKFZp547M072 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp547M072, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547M072 BINDING SITE, designated SEQ ID:30614, to the nucleotide sequence of VGAM698 RNA, herein designated VGAM RNA, also designated SEQ ID:3409.

[28209] A function of VGAM698 is therefore inhibition of DKFZp547M072 (Accession XM\_028067). Accordingly, utilities of VGAM698 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547M072. KIAA1130 (Accession XM\_031104) is another VGAM698 host target gene. KIAA1130 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1130, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1130 BINDING SITE, designated SEQ ID:31285, to the nucleotide sequence of VGAM698 RNA, herein designated VGAM RNA, also designated SEQ ID:3409.

[28210] Another function of VGAM698 is therefore inhibition of KIAA1130 (Accession XM\_031104). Accordingly, utilities of VGAM698 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1130. p25 (Accession NM\_007030) is another VGAM698 host target gene. p25 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by p25, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of p25 BINDING SITE, designated SEQ ID:13893, to the nucleotide sequence of VGAM698 RNA, herein designated VGAM RNA, also designated SEQ ID:3409.

[28211] Another function of VGAM698 is therefore inhibition of p25 (Accession NM\_007030). Accordingly, utilities of VGAM698 include diagnosis, prevention and treatment of diseases and clinical conditions associated with p25. LOC144501 (Accession XM\_096612) is another VGAM698

host target gene. LOC144501 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144501, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144501 BINDING SITE, designated SEQ ID:40426, to the nucleotide sequence of VGAM698 RNA, herein designated VGAM RNA, also designated SEQ ID:3409.

[28212] Another function of VGAM698 is therefore inhibition of LOC144501 (Accession XM\_096612). Accordingly, utilities of VGAM698 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144501. LOC150333 (Accession XM\_097874) is another VGAM698 host target gene. LOC150333 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150333, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150333 BINDING SITE, designated SEQ ID:41198, to the nucleotide sequence of VGAM698 RNA, herein designated VGAM RNA, also designated SEQ ID:3409.

[28213] Another function of VGAM698 is therefore inhibition of LOC150333 (Accession XM\_097874). Accordingly, utilities of VGAM698 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150333. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 699 (VGAM699) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28214] VGAM699 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM699 was detected is described hereinabove with reference to Figs. 1–8.

[28215] VGAM699 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Coronavirus 229E. VGAM699 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28216] VGAM699 gene encodes a VGAM699 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM699

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM699 precursor RNA is designated SEQ ID:685, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:685 is located at position 2991 relative to the genome of Human Coronavirus 229E.

[28217] VGAM699 precursor RNA folds onto itself, forming VGAM699 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28218] An enzyme complex designated DICER COMPLEX, `dices` the VGAM699 folded precursor RNA into VGAM699 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 48%) nucleotide sequence of VGAM699 RNA is designated SEQ ID:3410, and is provided hereinbelow with reference to the sequence listing part.

[28219] VGAM699 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM699 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM699 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[28220] VGAM699 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM699 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM699 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM699 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM699 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[28221] The complementary binding of VGAM699 RNA, herein designated VGAM RNA, to host target binding sites on VGAM699 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM699 host target RNA into VGAM699 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28222] It is appreciated that VGAM699 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM699 host target genes. The mRNA of each one of this plurality of VGAM699 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM699 RNA, herein designated VGAM RNA, and which when bound by VGAM699 RNA causes inhibition of translation of respective one or more VGAM699 host target proteins.

[28223] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM699 gene, herein designated VGAM GENE, on one or more VGAM699 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[28224] It is yet further appreciated that a function of VGAM699 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM699 include diagnosis, prevention and treatment of viral infection by Human Coronavirus 229E. Specific functions, and accordingly utilities, of VGAM699 correlate with, and may be deduced from, the identity of the host target genes which VGAM699 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28225] Nucleotide sequences of the VGAM699 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM699 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM699 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM699 are further described hereinbelow with reference to Table 1.

[28226] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM699 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM699 RNA, herein designated VGAM RNA, are described hereinbelow with refer-

ence to Table 2.

[28227] As mentioned hereinabove with reference to Fig. 1, a function of VGAM699 gene, herein designated VGAM is inhibition of expression of VGAM699 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM699 correlate with, and may be deduced from, the identity of the target genes which VGAM699 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28228] Amylo-1, 6-glucosidase, 4-alpha-glucanotransferase (glycogen debranching enzyme, glycogen storage disease type III) (AGL, Accession NM\_000646) is a VGAM699 host target gene. AGL BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by AGL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AGL BINDING SITE, designated SEQ ID:6302, to the nucleotide sequence of VGAM699 RNA, herein designated VGAM RNA, also designated SEQ ID:3410.

[28229] A function of VGAM699 is therefore inhibition of Amylo-1, 6-glucosidase, 4-alpha-glucanotransferase (glycogen debranching enzyme, glycogen storage disease type III)

(AGL, Accession NM\_000646). Accordingly, utilities of VGAM699 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AGL. ATPase, Class I, Type 8B, Member 2 (ATP8B2, Accession XM\_036933) is another VGAM699 host target gene.

ATP8B2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP8B2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP8B2 BINDING SITE, designated SEQ ID:32510, to the nucleotide sequence of VGAM699 RNA, herein designated VGAM RNA, also designated SEQ ID:3410.

[28230] Another function of VGAM699 is therefore inhibition of ATPase, Class I, Type 8B, Member 2 (ATP8B2, Accession XM\_036933). Accordingly, utilities of VGAM699 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP8B2. Cholinergic Receptor, Nicotinic, Beta Polypeptide 2 (neuronal) (CHRNA2, Accession NM\_000748) is another VGAM699 host target gene. CHRNA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

CHRNA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHRNA2 BINDING SITE, designated SEQ ID:6400, to the nucleotide sequence of VGAM699 RNA, herein designated VGAM RNA, also designated SEQ ID:3410.

[28231] Another function of VGAM699 is therefore inhibition of Cholinergic Receptor, Nicotinic, Beta Polypeptide 2 (neuronal) (CHRNA2, Accession NM\_000748), a gene which mediates fast signal transmission at synapses. Accordingly, utilities of VGAM699 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHRNA2. The function of CHRNA2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM166. Paired Box Gene 9 (PAX9, Accession NM\_006194) is another VGAM699 host target gene. PAX9 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PAX9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of PAX9 BINDING SITE, designated SEQ ID:12866, to the nucleotide sequence of VGAM699 RNA, herein designated VGAM RNA, also designated SEQ ID:3410.

[28232] Another function of VGAM699 is therefore inhibition of Paired Box Gene 9 (PAX9, Accession NM\_006194), a gene which is a key regulator during the development of a wide range of organ hypodontia. Accordingly, utilities of VGAM699 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAX9. The function of PAX9 has been established by previous studies. Stockton et al. (2000) identified a frameshift mutation within the paired domain of PAX9, following genomewide analysis of a family segregating autosomal dominant oligodontia (OMIM Ref. No. 604625). Affected members had normal primary dentition but lacked most permanent molars. In addition to lack of permanent molars, some individuals also lacked maxillary and/or mandibular second premolars, as well as mandibular central incisors. Stockton et al. (2000) first performed a genomewide search using microsatellite markers and identified a critical region that included the PAX9 gene on chromosome 14. Mutation analysis of the coding regions of exons 2–4 of PAX9

demonstrated an insertion of a G at nucleotide 219, resulting in frameshift. Relative to the finding of other abnormalities in PAX9 knockout mice, Stockton et al. (2000) noted that affected members of this family showed no limb anomalies and no evidence for calcium metabolism abnormalities or compromised immune system.

Oligodontia is defined as agenesis of 6 or more permanent teeth without associated systemic disorders, and hypodontia as absence of less than 6 teeth. The incidence of familial tooth agenesis varies with each class of teeth.

Most commonly affected are third molars ('wisdom teeth'), followed by either upper lateral incisors or lower second premolars; agenesis involving first and second molars is very rare. The homeo box gene MSX1 (OMIM Ref. No. 142983) was found to be mutant in a single family with agenesis of the second premolars and third molars. Animal model experiments lend further support to the function of PAX9. Peters et al. (1998) generated Pax9-deficient mice and showed that PAX9 is essential for the development of a variety of organs and skeletal elements. Homozygous Pax9 mutant mice died shortly after birth, most likely as a consequence of a cleft secondary palate. Homozygous knockout mice lacked a thymus, parathyroid

glands, and ultimobranchial bodies, organs which are derived from the pharyngeal pouches. In all limbs, a supernumerary preaxial digit was formed, but the flexor of the hindlimb toes was missing. Furthermore, craniofacial and visceral skeletogenesis was disturbed, and all teeth were absent. In Pax9-deficient embryos, tooth development was arrested at the bud stage. At that stage, Pax9 is required for the mesenchymal expression of Bmp4, Msx1, and Lef1, suggesting a role for Pax9 in the establishment of the inductive capacity of the tooth mesenchyme.

[28233] It is appreciated that the abovementioned animal model for PAX9 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[28234] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[28235] Stockton, D. W.; Das, P.; Goldenberg, M.; D'Souza, R. N.; Patel, P. I. : Mutation of PAX9 is associated with oligodontia. (Letter) Nature Genet. 24: 18–19, 2000. ; and

[28236] Peters, H.; Neubuser, A.; Kratochwil, K.; Balling, R. : Pax9-deficient mice lack pharyngeal pouch derivatives and teeth and exhibit craniofacial and limb abnormalities.

Genes Dev. 12: 2.

[28237] Further studies establishing the function and utilities of PAX9 are found in John Hopkins OMIM database record ID 167416, and in cited publications numbered 10949–10952, 1071 and 10953–10954 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Tumor Necrosis Factor (ligand) Superfamily, Member 8 (TNFSF8, Accession NM\_001244) is another VGAM699 host target gene. TNFSF8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TNFSF8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFSF8 BINDING SITE, designated SEQ ID:6913, to the nucleotide sequence of VGAM699 RNA, herein designated VGAM RNA, also designated SEQ ID:3410.

[28238] Another function of VGAM699 is therefore inhibition of Tumor Necrosis Factor (ligand) Superfamily, Member 8 (TNFSF8, Accession NM\_001244), a gene which cytokine that binds to tnfrsf8/cd30. induces proliferation of t cells. Accordingly, utilities of VGAM699 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with TNFSF8. The function of TNFSF8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM655. Tetratricopeptide Repeat Domain 3 (TTC3, Accession NM\_003316) is another VGAM699 host target gene. TTC3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TTC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TTC3 BINDING SITE, designated SEQ ID:9313, to the nucleotide sequence of VGAM699 RNA, herein designated VGAM RNA, also designated SEQ ID:3410.

[28239] Another function of VGAM699 is therefore inhibition of Tetratricopeptide Repeat Domain 3 (TTC3, Accession NM\_003316), a gene which contains tetratricopeptide repeat (TPR) motifs. Accordingly, utilities of VGAM699 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TTC3. The function of TTC3 has been established by previous studies. The Down syndrome (DS; 190685) region on chromosome 21, which is responsible for the main features of DS, has been de-

fined by analysis of DS patients with partial trisomy 21. Within the DS region, Ohira et al. (1996) constructed a 1.6-Mb P1 contig map on 21q22.2 and performed cDNA library screening and exon trapping using these P1 clones and a human fetal brain cDNA library. They obtained 67 cDNA fragments and 52 possible exons. Among them, 23 cDNA fragments and 4 exons were derived from a single gene by localization on P1 clones and by Northern analysis. To obtain the full-length cDNA sequence, longer cDNA clones were further screened from another human cDNA library that was enriched with longer cDNA species. These clones were assembled to a sequence of 9,045 bp. The cDNA encodes a 2,025-amino acid protein containing 3 tetratricopeptide repeat (TPR) motifs (amino acid residues 231–264, 265–298, and 299–332). The authors symbolized the gene TPRD for a gene containing the TPR motifs on the Down syndrome region. The TPR domain has been found in protein phosphatases and in other proteins involved in the regulation of RNA synthesis or mitosis. Independently, Tsukahara et al. (1996) identified and cloned a 9,078-bp cDNA, which they designated TPRDI, from the Down syndrome critical region by exon trapping. The cDNA encodes a putative protein (TPRDI) of 2,025

amino acid residues. Two isoforms, TPRDII (8,992 bp) and TPRDIII (7,416 bp), were also isolated. TPRDII, which is probably an alternative splicing product from the TPRD gene transcript, encodes 2 large open reading frames of 200 and 1,792 amino acid residues, respectively. TPRDIII, which is probably generated by transcription from an alternative start site of the TPRD gene, encodes a putative protein of 1,715 amino acid residues. Northern blot analysis revealed that TPRDI and its isoforms are present in 7- to 17-day mouse embryos and in all the human adult and fetal tissues examined. TPRDI has 3 units of the 34-amino acid TPR motif, which may mediate interaction with various proteins. A larger open reading frame encoded by TPRDII also has 3 units of the TPR motif, but TPRDIII has only two-thirds of this motif unit. Thus, the TPRD gene may belong to the TPR gene family. Near-central and C-terminal regions of TPRDs showed some homology to several matrix proteins such as trichohyalin and bullous pemphigoid antigen. The authors speculated that overexpression of the TPRD gene may cause several morphologic anomalies observed in Down syndrome.

[28240] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [28241] Ohira, M.; Ootsuyama A.; Suzuki, E.; Ichikawa, H.; Seki, N.; Nagase, T.; Monura, N.; Ohki, M. : Identification of a novel human gene containing the tetratricopeptide repeat domain from the Down syndrome region of chromosome 21. DNA Res. 3: 9–16, 1996. ; and
- [28242] Tsukahara, F.; Hattori, M.; Muraki, T.; Sakaki, Y. : Identification and cloning of a novel cDNA belonging to tetratricopeptide repeat gene family from Down syndrome-critical region 21q22.2.
- [28243] Further studies establishing the function and utilities of TTC3 are found in John Hopkins OMIM database record ID 602259, and in cited publications numbered 931–932 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. ATP-binding Cassette, Sub-family A (ABC1), Member 10 (ABCA10, Accession NM\_080282) is another VGAM699 host target gene. ABCA10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ABCA10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCA10 BINDING SITE, designated SEQ

ID:27824, to the nucleotide sequence of VGAM699 RNA, herein designated VGAM RNA, also designated SEQ ID:3410.

[28244] Another function of VGAM699 is therefore inhibition of ATP-binding Cassette, Sub-family A (ABC1), Member 10 (ABCA10, Accession NM\_080282). Accordingly, utilities of VGAM699 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCA10. ADMP (Accession NM\_145035) is another VGAM699 host target gene. ADMP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADMP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADMP BINDING SITE, designated SEQ ID:29654, to the nucleotide sequence of VGAM699 RNA, herein designated VGAM RNA, also designated SEQ ID:3410.

[28245] Another function of VGAM699 is therefore inhibition of ADMP (Accession NM\_145035). Accordingly, utilities of VGAM699 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADMP. AP1 Gamma Subunit Binding Protein 1 (AP1GBP1, Acces-

sion NM\_080551) is another VGAM699 host target gene. AP1GBP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by AP1GBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AP1GBP1 BINDING SITE, designated SEQ ID:27876, to the nucleotide sequence of VGAM699 RNA, herein designated VGAM RNA, also designated SEQ ID:3410.

[28246] Another function of VGAM699 is therefore inhibition of AP1 Gamma Subunit Binding Protein 1 (AP1GBP1, Accession NM\_080551). Accordingly, utilities of VGAM699 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP1GBP1. Chloride Intracellular Channel 2 (CLIC2, Accession NM\_001289) is another VGAM699 host target gene. CLIC2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CLIC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLIC2 BINDING SITE, designated SEQ ID:6965, to the nucleotide se-

quence of VGAM699 RNA, herein designated VGAM RNA, also designated SEQ ID:3410.

[28247] Another function of VGAM699 is therefore inhibition of Chloride Intracellular Channel 2 (CLIC2, Accession NM\_001289). Accordingly, utilities of VGAM699 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLIC2. FLJ10246 (Accession NM\_018038) is another VGAM699 host target gene. FLJ10246 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10246, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10246 BINDING SITE, designated SEQ ID:19783, to the nucleotide sequence of VGAM699 RNA, herein designated VGAM RNA, also designated SEQ ID:3410.

[28248] Another function of VGAM699 is therefore inhibition of FLJ10246 (Accession NM\_018038). Accordingly, utilities of VGAM699 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10246. FLJ10701 (Accession NM\_018183) is another VGAM699 host target gene. FLJ10701 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by FLJ10701, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10701 BINDING SITE, designated SEQ ID:20023, to the nucleotide sequence of VGAM699 RNA, herein designated VGAM RNA, also designated SEQ ID:3410.

[28249] Another function of VGAM699 is therefore inhibition of FLJ10701 (Accession NM\_018183). Accordingly, utilities of VGAM699 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10701. FLJ14297 (Accession NM\_024903) is another VGAM699 host target gene. FLJ14297 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14297, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14297 BINDING SITE, designated SEQ ID:24390, to the nucleotide sequence of VGAM699 RNA, herein designated VGAM RNA, also designated SEQ ID:3410.

[28250] Another function of VGAM699 is therefore inhibition of

FLJ14297 (Accession NM\_024903). Accordingly, utilities of VGAM699 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14297. FLJ20618 (Accession NM\_017903) is another VGAM699 host target gene. FLJ20618 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20618, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20618 BINDING SITE, designated SEQ ID:19568, to the nucleotide sequence of VGAM699 RNA, herein designated VGAM RNA, also designated SEQ ID:3410.

[28251] Another function of VGAM699 is therefore inhibition of FLJ20618 (Accession NM\_017903). Accordingly, utilities of VGAM699 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20618. Keratin, Hair, Basic, 2 (KRTHB2, Accession NM\_033033) is another VGAM699 host target gene. KRTHB2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KRTHB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of KRTHB2 BINDING SITE, designated SEQ ID:26923, to the nucleotide sequence of VGAM699 RNA, herein designated VGAM RNA, also designated SEQ ID:3410.

[28252] Another function of VGAM699 is therefore inhibition of Keratin, Hair, Basic, 2 (KRTHB2, Accession NM\_033033). Accordingly, utilities of VGAM699 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KRTHB2. MGC21675 (Accession NM\_052861) is another VGAM699 host target gene. MGC21675 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC21675, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC21675 BINDING SITE, designated SEQ ID:27443, to the nucleotide sequence of VGAM699 RNA, herein designated VGAM RNA, also designated SEQ ID:3410.

[28253] Another function of VGAM699 is therefore inhibition of MGC21675 (Accession NM\_052861). Accordingly, utilities of VGAM699 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

MGC21675. Squamous Cell Carcinoma Antigen Recognised By T Cells 3 (SART3, Accession NM\_014706) is another VGAM699 host target gene. SART3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SART3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SART3 BINDING SITE, designated SEQ ID:16249, to the nucleotide sequence of VGAM699 RNA, herein designated VGAM RNA, also designated SEQ ID:3410.

[28254] Another function of VGAM699 is therefore inhibition of Squamous Cell Carcinoma Antigen Recognised By T Cells 3 (SART3, Accession NM\_014706). Accordingly, utilities of VGAM699 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SART3. Ubiquitin-like, Containing PHD and RING Finger Domains, 2 (UHRF2, Accession XM\_055929) is another VGAM699 host target gene. UHRF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UHRF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of UHRF2 BINDING SITE, designated SEQ ID:36354, to the nucleotide sequence of VGAM699 RNA, herein designated VGAM RNA, also designated SEQ ID:3410.

[28255] Another function of VGAM699 is therefore inhibition of Ubiquitin-like, Containing PHD and RING Finger Domains, 2 (UHRF2, Accession XM\_055929). Accordingly, utilities of VGAM699 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UHRF2. LOC147093 (Accession XM\_097184) is another VGAM699 host target gene. LOC147093 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147093, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147093 BINDING SITE, designated SEQ ID:40799, to the nucleotide sequence of VGAM699 RNA, herein designated VGAM RNA, also designated SEQ ID:3410.

[28256] Another function of VGAM699 is therefore inhibition of LOC147093 (Accession XM\_097184). Accordingly, utilities of VGAM699 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC147093. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 700 (VGAM700) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28257] VGAM700 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM700 was detected is described hereinabove with reference to Figs. 1–8.

[28258] VGAM700 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Coronavirus 229E. VGAM700 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28259] VGAM700 gene encodes a VGAM700 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM700 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM700 precursor RNA is designated SEQ ID:686, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:686 is located at position 5282 relative to the genome of Human Coronavirus 229E.

[28260] VGAM700 precursor RNA folds onto itself, forming VGAM700 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28261] An enzyme complex designated DICER COMPLEX, `dices` the VGAM700 folded precursor RNA into VGAM700 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM700 RNA is designated SEQ ID:3411, and is provided hereinbelow with reference to the sequence listing part.

[28262] VGAM700 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM700 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM700 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[28263] VGAM700 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM700 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM700 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM700 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM700 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[28264] The complementary binding of VGAM700 RNA, herein designated VGAM RNA, to host target binding sites on VGAM700 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM700 host target RNA into VGAM700 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28265] It is appreciated that VGAM700 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM700 host target genes. The mRNA of each one of this plurality of VGAM700 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM700 RNA, herein designated VGAM RNA, and which when bound by VGAM700 RNA causes in-

hibition of translation of respective one or more VGAM700 host target proteins.

[28266] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM700 gene, herein designated VGAM GENE, on one or more VGAM700 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[28267] It is yet further appreciated that a function of VGAM700 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM700 include diagnosis, prevention and

treatment of viral infection by Human Coronavirus 229E. Specific functions, and accordingly utilities, of VGAM700 correlate with, and may be deduced from, the identity of the host target genes which VGAM700 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [28268] Nucleotide sequences of the VGAM700 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM700 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM700 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM700 are further described hereinbelow with reference to Table 1.
- [28269] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM700 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM700 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [28270] As mentioned hereinabove with reference to Fig. 1, a function of VGAM700 gene, herein designated VGAM is inhibition of expression of VGAM700 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM700 correlate with, and may be deduced from, the identity of the target genes which VGAM700 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28271] Splicing Factor, Arginine/serine-rich 2, Interacting Protein (SFRS2IP, Accession NM\_004719) is a VGAM700 host target gene. SFRS2IP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SFRS2IP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SFRS2IP BINDING SITE, designated SEQ ID:11083, to the nucleotide sequence of VGAM700 RNA, herein designated VGAM RNA, also designated SEQ ID:3411.

[28272] A function of VGAM700 is therefore inhibition of Splicing Factor, Arginine/serine-rich 2, Interacting Protein (SFRS2IP, Accession NM\_004719), a gene which plays an essential role in pre-mRNA splicing. Accordingly, utilities of VGAM700 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFRS2IP. The function of SFRS2IP has been established by

previous studies. Like other SR proteins, the SC35 (OMIM Ref. No. 600813) splicing factor contains an arginine/serine-rich (RS) domain and an RNA-binding motif. Using a yeast 2-hybrid screen with SC35 as bait, Zhang and Wu (1998) isolated a HeLa cell partial cDNA encoding SIP1, a novel SC35-interacting protein. They used the partial cDNA to screen a HeLa cell library and recovered cDNAs corresponding to the entire SIP1 coding region. The predicted 1,403-amino acid protein contains an RS domain similar to those found in several SR proteins and a region of weak similarity to the *Drosophila* splicing regulator suppressor of white-apricot (SWAP; 601945). In addition, the C-terminal region of SIP1 contains an RNA polymerase II C-terminal domain (CTD)-binding motif. Although the predicted molecular mass of SIP1 is 158 kD, the protein migrates at 210 kD by SDS-PAGE. The authors suggested that this discrepancy might result from posttranslational modifications such as phosphorylation, which is known to cause aberrant migration of several RS domain-containing proteins in SDS-PAGE. Yeast 2-hybrid assays and immunoprecipitation studies showed that SIP1 interacts with several SR proteins as well as with U2AF65 (OMIM Ref. No. 191318) and U1-70K (OMIM Ref. No. 180740), proteins

associated with the 3-prime and 5-prime splice sites, respectively. Antibodies against SIP1 depleted splicing activity from a HeLa cell nuclear extract. In the SIP1-depleted nuclear extracts, the authors found that the formation of prespliceosomal complexes A and B was deficient. Zhang and Wu (1998) concluded that SIP1 is a novel RS domain protein required for pre-mRNA splicing. By performing a yeast 2-hybrid assay to identify proteins that interact with CTD, Tanner et al. (1997) isolated partial cDNAs encoding SIP1, which they called CTD-associated SR protein 11 (OMIM Ref. No. CASP11) or SR-related protein of 129 kD (SRrp129). Northern blot analysis detected expression of the approximately 6-kb SRrp129 mRNA in all tissues tested.

[28273] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[28274] Zhang, W.-J.; Wu, J. Y. : Sip1, a novel RS domain-containing protein essential for pre-mRNA splicing. *Molec. Cell. Biol.* 18: 676-684, 1998. ; and

[28275] Tanner, S.; Stagljar, I.; Georgiev, O.; Schaffner, W.; Bourquin, J.-P. : A novel SR-related protein specifically interacts with the carboxy-terminal domain (CTD) of RNA

polymerase II through.

[28276] Further studies establishing the function and utilities of SFRS2IP are found in John Hopkins OMIM database record ID 603668, and in cited publications numbered 992–993 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.FLJ21477 (Accession NM\_025153) is another VGAM700 host target gene. FLJ21477 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ21477, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21477 BINDING SITE, designated SEQ ID:24791, to the nucleotide sequence of VGAM700 RNA, herein designated VGAM RNA, also designated SEQ ID:3411.

[28277] Another function of VGAM700 is therefore inhibition of FLJ21477 (Accession NM\_025153). Accordingly, utilities of VGAM700 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21477. LOC220477 (Accession XM\_071675) is another VGAM700 host target gene. LOC220477 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of

mRNA encoded by LOC220477, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220477 BINDING SITE, designated SEQ ID:37410, to the nucleotide sequence of VGAM700 RNA, herein designated VGAM RNA, also designated SEQ ID:3411.

[28278] Another function of VGAM700 is therefore inhibition of LOC220477 (Accession XM\_071675). Accordingly, utilities of VGAM700 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220477. LOC255147 (Accession XM\_171024) is another VGAM700 host target gene. LOC255147 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255147, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255147 BINDING SITE, designated SEQ ID:45803, to the nucleotide sequence of VGAM700 RNA, herein designated VGAM RNA, also designated SEQ ID:3411.

[28279] Another function of VGAM700 is therefore inhibition of LOC255147 (Accession XM\_171024). Accordingly, utilities

of VGAM700 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255147. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 701 (VGAM701) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28280] VGAM701 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM701 was detected is described hereinabove with reference to Figs. 1–8.

[28281] VGAM701 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Coronavirus 229E. VGAM701 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28282] VGAM701 gene encodes a VGAM701 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM701 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide se–

quence of VGAM701 precursor RNA is designated SEQ ID:687, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:687 is located at position 21134 relative to the genome of Human Coronavirus 229E.

[28283] VGAM701 precursor RNA folds onto itself, forming VGAM701 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28284] An enzyme complex designated DICER COMPLEX, `dices` the VGAM701 folded precursor RNA into VGAM701 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM701 RNA is designated SEQ ID:3412, and

is provided hereinbelow with reference to the sequence listing part.

[28285] VGAM701 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM701 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM701 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[28286] VGAM701 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM701 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM701 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM701 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM701 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[28287] The complementary binding of VGAM701 RNA, herein designated VGAM RNA, to host target binding sites on VGAM701 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM701 host target RNA into VGAM701 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28288] It is appreciated that VGAM701 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM701 host target genes. The mRNA of each one of this plurality of VGAM701 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM701 RNA, herein designated VGAM RNA, and which when bound by VGAM701 RNA causes inhibition of translation of respective one or more VGAM701 host target proteins.

[28289] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM701 gene, herein designated VGAM GENE, on one or more VGAM701 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[28290] It is yet further appreciated that a function of VGAM701 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM701 include diagnosis, prevention and treatment of viral infection by Human Coronavirus 229E. Specific functions, and accordingly utilities, of VGAM701 correlate with, and may be deduced from, the identity of the host target genes which VGAM701 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28291] Nucleotide sequences of the VGAM701 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM701 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM701 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM701 are further described hereinbelow with reference to Table 1.

[28292] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM701 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM701 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28293] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM701 gene, herein designated VGAM is inhibition of expression of VGAM701 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM701 correlate with, and may be deduced from, the identity of the target genes which VGAM701 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28294] Chromosome 20 Open Reading Frame 45 (C20orf45, Accession NM\_016045) is a VGAM701 host target gene. C20orf45 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf45, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf45 BINDING SITE, designated SEQ ID:18120, to the nucleotide sequence of VGAM701 RNA, herein designated VGAM RNA, also designated SEQ ID:3412.

[28295] A function of VGAM701 is therefore inhibition of Chromosome 20 Open Reading Frame 45 (C20orf45, Accession NM\_016045). Accordingly, utilities of VGAM701 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf45. FLJ22060

(Accession NM\_024612) is another VGAM701 host target gene. FLJ22060 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22060, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22060 BINDING SITE, designated SEQ ID:23865, to the nucleotide sequence of VGAM701 RNA, herein designated VGAM RNA, also designated SEQ ID:3412.

[28296] Another function of VGAM701 is therefore inhibition of FLJ22060 (Accession NM\_024612). Accordingly, utilities of VGAM701 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22060. LOC130507 (Accession XM\_059440) is another VGAM701 host target gene. LOC130507 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC130507, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130507 BINDING SITE, designated SEQ ID:36996, to the nucleotide sequence of VGAM701 RNA, herein designated VGAM RNA,

also designated SEQ ID:3412.

[28297] Another function of VGAM701 is therefore inhibition of LOC130507 (Accession XM\_059440). Accordingly, utilities of VGAM701 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130507. LOC152185 (Accession NM\_144718) is another VGAM701 host target gene. LOC152185 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152185, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152185 BINDING SITE, designated SEQ ID:29538, to the nucleotide sequence of VGAM701 RNA, herein designated VGAM RNA, also designated SEQ ID:3412.

[28298] Another function of VGAM701 is therefore inhibition of LOC152185 (Accession NM\_144718). Accordingly, utilities of VGAM701 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152185. LOC154089 (Accession XM\_087846) is another VGAM701 host target gene. LOC154089 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC154089, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154089 BINDING SITE, designated SEQ ID:39462, to the nucleotide sequence of VGAM701 RNA, herein designated VGAM RNA, also designated SEQ ID:3412.

[28299] Another function of VGAM701 is therefore inhibition of LOC154089 (Accession XM\_087846). Accordingly, utilities of VGAM701 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154089. LOC203411 (Accession XM\_117547) is another VGAM701 host target gene. LOC203411 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203411, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203411 BINDING SITE, designated SEQ ID:43564, to the nucleotide sequence of VGAM701 RNA, herein designated VGAM RNA, also designated SEQ ID:3412.

[28300] Another function of VGAM701 is therefore inhibition of LOC203411 (Accession XM\_117547). Accordingly, utilities of VGAM701 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC203411. LOC51634 (Accession NM\_016024) is another VGAM701 host target gene. LOC51634 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51634, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51634 BINDING SITE, designated SEQ ID:18104, to the nucleotide sequence of VGAM701 RNA, herein designated VGAM RNA, also designated SEQ ID:3412.

[28301] Another function of VGAM701 is therefore inhibition of LOC51634 (Accession NM\_016024). Accordingly, utilities of VGAM701 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51634. LOC91923 (Accession XM\_041526) is another VGAM701 host target gene. LOC91923 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91923, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91923 BINDING SITE, designated SEQ ID:33542, to the

nucleotide sequence of VGAM701 RNA, herein designated VGAM RNA, also designated SEQ ID:3412.

[28302] Another function of VGAM701 is therefore inhibition of LOC91923 (Accession XM\_041526). Accordingly, utilities of VGAM701 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91923. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 702 (VGAM702) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28303] VGAM702 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM702 was detected is described hereinabove with reference to Figs. 1–8.

[28304] VGAM702 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Coronavirus 229E. VGAM702 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28305] VGAM702 gene encodes a VGAM702 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM702 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM702 precursor RNA is designated SEQ ID:688, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:688 is located at position 22902 relative to the genome of Human Coronavirus 229E.

[28306] VGAM702 precursor RNA folds onto itself, forming VGAM702 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28307] An enzyme complex designated DICER COMPLEX, `dices` the VGAM702 folded precursor RNA into VGAM702 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM702 RNA is designated SEQ ID:3413, and is provided hereinbelow with reference to the sequence listing part.

[28308] VGAM702 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM702 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM702 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[28309] VGAM702 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM702 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM702 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM702 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM702 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[28310] The complementary binding of VGAM702 RNA, herein designated VGAM RNA, to host target binding sites on VGAM702 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM702 host target RNA into VGAM702 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28311] It is appreciated that VGAM702 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM702 host target genes. The mRNA of each one of this plurality of VGAM702 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM702 RNA, herein designated VGAM RNA, and which when bound by VGAM702 RNA causes inhibition of translation of respective one or more VGAM702 host target proteins.

[28312] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM702 gene, herein designated VGAM GENE, on one or more VGAM702 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[28313] It is yet further appreciated that a function of VGAM702 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM702 include diagnosis, prevention and treatment of viral infection by Human Coronavirus 229E. Specific functions, and accordingly utilities, of VGAM702 correlate with, and may be deduced from, the identity of the host target genes which VGAM702 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28314] Nucleotide sequences of the VGAM702 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM702 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM702 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM702 are further described hereinbelow with reference to Table 1.

[28315] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM702 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM702 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28316] As mentioned hereinabove with reference to Fig. 1, a function of VGAM702 gene, herein designated VGAM is inhibition of expression of VGAM702 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM702 correlate with, and may be deduced from, the identity of the target genes which VGAM702 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28317] Splicing Factor, Arginine/serine-rich 2, Interacting Protein (SFRS2IP, Accession NM\_004719) is a VGAM702 host target gene. SFRS2IP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SFRS2IP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SFRS2IP BINDING SITE, designated SEQ ID:11082, to the nucleotide sequence of VGAM702 RNA, herein designated VGAM RNA, also designated SEQ ID:3413.

[28318] A function of VGAM702 is therefore inhibition of Splicing

Factor, Arginine/serine-rich 2, Interacting Protein (SFRS2IP, Accession NM\_004719), a gene which plays an essential role in pre-mRNA splicing. Accordingly, utilities of VGAM702 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFRS2IP. The function of SFRS2IP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM700. FLJ13456 (Accession XM\_038291) is another VGAM702 host target gene. FLJ13456 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13456, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13456 BINDING SITE, designated SEQ ID:32795, to the nucleotide sequence of VGAM702 RNA, herein designated VGAM RNA, also designated SEQ ID:3413.

[28319] Another function of VGAM702 is therefore inhibition of FLJ13456 (Accession XM\_038291). Accordingly, utilities of VGAM702 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13456. FLJ21276 (Accession NM\_024633) is another VGAM702

host target gene. FLJ21276 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21276, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21276 BINDING SITE, designated SEQ ID:23903, to the nucleotide sequence of VGAM702 RNA, herein designated VGAM RNA, also designated SEQ ID:3413.

[28320] Another function of VGAM702 is therefore inhibition of FLJ21276 (Accession NM\_024633). Accordingly, utilities of VGAM702 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21276. KIAA0940 (Accession NM\_014912) is another VGAM702 host target gene. KIAA0940 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0940, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0940 BINDING SITE, designated SEQ ID:17149, to the nucleotide sequence of VGAM702 RNA, herein designated VGAM RNA, also designated SEQ ID:3413.

[28321] Another function of VGAM702 is therefore inhibition of KIAA0940 (Accession NM\_014912). Accordingly, utilities of VGAM702 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0940. KIAA1363 (Accession XM\_045056) is another VGAM702 host target gene. KIAA1363 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1363, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1363 BINDING SITE, designated SEQ ID:34330, to the nucleotide sequence of VGAM702 RNA, herein designated VGAM RNA, also designated SEQ ID:3413.

[28322] Another function of VGAM702 is therefore inhibition of KIAA1363 (Accession XM\_045056). Accordingly, utilities of VGAM702 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1363. Keratin, Hair, Basic, 5 (KRTHB5, Accession NM\_002283) is another VGAM702 host target gene. KRTHB5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KRTHB5, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KRTHB5 BINDING SITE, designated SEQ ID:8065, to the nucleotide sequence of VGAM702 RNA, herein designated VGAM RNA, also designated SEQ ID:3413.

[28323] Another function of VGAM702 is therefore inhibition of Keratin, Hair, Basic, 5 (KRTHB5, Accession NM\_002283). Accordingly, utilities of VGAM702 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KRTHB5. MGC12466 (Accession NM\_033213) is another VGAM702 host target gene. MGC12466 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC12466, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC12466 BINDING SITE, designated SEQ ID:27065, to the nucleotide sequence of VGAM702 RNA, herein designated VGAM RNA, also designated SEQ ID:3413.

[28324] Another function of VGAM702 is therefore inhibition of MGC12466 (Accession NM\_033213). Accordingly, utilities

of VGAM702 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC12466. Protocadherin 17 (PCDH17, Accession NM\_014459) is another VGAM702 host target gene. PCDH17 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PCDH17, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDH17 BINDING SITE, designated SEQ ID:15813, to the nucleotide sequence of VGAM702 RNA, herein designated VGAM RNA, also designated SEQ ID:3413.

[28325] Another function of VGAM702 is therefore inhibition of Protocadherin 17 (PCDH17, Accession NM\_014459). Accordingly, utilities of VGAM702 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH17. UBA2 (Accession NM\_005499) is another VGAM702 host target gene. UBA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UBA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of UBA2 BINDING SITE, designated SEQ ID:12002, to the nucleotide sequence of VGAM702 RNA, herein designated VGAM RNA, also designated SEQ ID:3413.

[28326] Another function of VGAM702 is therefore inhibition of UBA2 (Accession NM\_005499). Accordingly, utilities of VGAM702 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBA2. LOC88523 (Accession NM\_033111) is another VGAM702 host target gene. LOC88523 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC88523, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC88523 BINDING SITE, designated SEQ ID:26960, to the nucleotide sequence of VGAM702 RNA, herein designated VGAM RNA, also designated SEQ ID:3413.

[28327] Another function of VGAM702 is therefore inhibition of LOC88523 (Accession NM\_033111). Accordingly, utilities of VGAM702 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC88523. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 703 (VGAM703) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28328] VGAM703 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM703 was detected is described hereinabove with reference to Figs. 1–8.

[28329] VGAM703 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Coronavirus 229E. VGAM703 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28330] VGAM703 gene encodes a VGAM703 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM703 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM703 precursor RNA is designated SEQ ID:689, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:689 is

located at position 22503 relative to the genome of Human Coronavirus 229E.

[28331] VGAM703 precursor RNA folds onto itself, forming VGAM703 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28332] An enzyme complex designated DICER COMPLEX, `dices` the VGAM703 folded precursor RNA into VGAM703 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM703 RNA is designated SEQ ID:3414, and is provided hereinbelow with reference to the sequence listing part.

[28333] VGAM703 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM703 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM703 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[28334] VGAM703 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM703 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM703 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM703 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM703 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[28335] The complementary binding of VGAM703 RNA, herein designated VGAM RNA, to host target binding sites on VGAM703 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM703 host target RNA into VGAM703 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28336] It is appreciated that VGAM703 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM703 host target genes. The mRNA of each one of this plurality of VGAM703 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM703 RNA, herein designated VGAM RNA, and which when bound by VGAM703 RNA causes inhibition of translation of respective one or more VGAM703

host target proteins.

[28337] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM703 gene, herein designated VGAM GENE, on one or more VGAM703 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[28338] It is yet further appreciated that a function of VGAM703 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM703 include diagnosis, prevention and treatment of viral infection by Human Coronavirus 229E.

Specific functions, and accordingly utilities, of VGAM703 correlate with, and may be deduced from, the identity of the host target genes which VGAM703 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28339] Nucleotide sequences of the VGAM703 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM703 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM703 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM703 are further described hereinbelow with reference to Table 1.

[28340] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM703 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM703 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28341] As mentioned hereinabove with reference to Fig. 1, a function of VGAM703 gene, herein designated VGAM is inhibition of expression of VGAM703 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM703 correlate with, and may be deduced from, the identity of the target genes which VGAM703 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28342] Chloride Channel 6 (CLCN6, Accession NM\_001286) is a VGAM703 host target gene. CLCN6 BINDING SITE1 through CLCN6 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CLCN6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLCN6 BINDING SITE1 through CLCN6 BINDING SITE3, designated SEQ ID:6958, SEQ ID:22335 and SEQ ID:22340 respectively, to the nucleotide sequence of VGAM703 RNA, herein designated VGAM RNA, also designated SEQ ID:3414.

[28343] A function of VGAM703 is therefore inhibition of Chloride Channel 6 (CLCN6, Accession NM\_001286), a gene which is a voltage-gated chloride channel. Accordingly, utilities of VGAM703 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLCN6. The function of CLCN6 and its association with various diseases and clinical conditions, has been established by

previous studies, as described hereinabove with reference to VGAM599.LOC150951 (Accession XM\_097975) is another VGAM703 host target gene. LOC150951 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150951, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150951 BINDING SITE, designated SEQ ID:41275, to the nucleotide sequence of VGAM703 RNA, herein designated VGAM RNA, also designated SEQ ID:3414.

[28344] Another function of VGAM703 is therefore inhibition of LOC150951 (Accession XM\_097975). Accordingly, utilities of VGAM703 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150951. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 704 (VGAM704) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28345] VGAM704 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM704 was detected is described hereinabove with reference to Figs. 1–8.

[28346] VGAM704 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Coronavirus 229E. VGAM704 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28347] VGAM704 gene encodes a VGAM704 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM704 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM704 precursor RNA is designated SEQ ID:690, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:690 is located at position 21569 relative to the genome of Human Coronavirus 229E.

[28348] VGAM704 precursor RNA folds onto itself, forming VGAM704 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA

genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28349] An enzyme complex designated DICER COMPLEX, `dices` the VGAM704 folded precursor RNA into VGAM704 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 54%) nucleotide sequence of VGAM704 RNA is designated SEQ ID:3415, and is provided hereinbelow with reference to the sequence listing part.

[28350] VGAM704 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM704 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM704 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[28351] VGAM704 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM704 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM704 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM704 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM704 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[28352] The complementary binding of VGAM704 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM704 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM704 host target RNA into VGAM704 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28353] It is appreciated that VGAM704 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM704 host target genes. The mRNA of each one of this plurality of VGAM704 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM704 RNA, herein designated VGAM RNA, and which when bound by VGAM704 RNA causes inhibition of translation of respective one or more VGAM704 host target proteins.

[28354] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM704 gene, herein designated VGAM GENE, on one or more VGAM704 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[28355] It is yet further appreciated that a function of VGAM704 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM704 include diagnosis, prevention and treatment of viral infection by Human Coronavirus 229E. Specific functions, and accordingly utilities, of VGAM704 correlate with, and may be deduced from, the identity of the host target genes which VGAM704 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28356] Nucleotide sequences of the VGAM704 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

5' duced 5' VGAM704 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM704 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM704 are further described hereinbelow with reference to Table 1.

[28357] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM704 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM704 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28358] As mentioned hereinabove with reference to Fig. 1, a function of VGAM704 gene, herein designated VGAM is inhibition of expression of VGAM704 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM704 correlate with, and may be deduced from, the identity of the target genes which VGAM704 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28359] Interleukin 1 Receptor, Type I (IL1R1, Accession NM\_000877) is a VGAM704 host target gene. IL1R1 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by IL1R1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL1R1 BINDING SITE, designated SEQ ID:6561, to the nucleotide sequence of VGAM704 RNA, herein designated VGAM RNA, also designated SEQ ID:3415.

[28360] A function of VGAM704 is therefore inhibition of Interleukin 1 Receptor, Type I (IL1R1, Accession NM\_000877), a gene which is a receptor for interleukin-1 alpha (il-1a), beta (il-1b), and interleukin-1 receptor antagonist protein (il-1ra). Accordingly, utilities of VGAM704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL1R1. The function of IL1R1 has been established by previous studies. Interleukin-1, which has a role as a mediator in inflammation, actually consists of 2 separate but related proteins, IL1-alpha (OMIM Ref. No. 147720) and IL1-beta (OMIM Ref. No. 147760). Dower et al. (1986) showed that the cell surface receptors for the 2 forms of interleukin-1 are identical. Sims et al. (1989) cloned the human IL1R gene and compared it with the mouse gene. Both contain a single membrane-spanning segment, a large cytoplasmic region, and an extracellular,

IL1-binding portion composed of 3 immunoglobulin-like domains. The IL1R gene expressed in human dermal fibroblasts was found to be identical to that expressed in T cells. By a combination of somatic cell hybrid analysis and chromosomal in situ hybridization, Copeland et al. (1991) mapped the IL1R gene to human chromosome 2q12. By RFLP analysis in interspecific backcrosses, Copeland et al. (1991) mapped the corresponding mouse gene at the centromeric end of chromosome 1, a region homologous to a portion of human chromosome 2

[28361] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[28362] Dower, S. K.; Kronheim, S. R.; Hopp, T. P.; Cantrell, M.; Deeley, M.; Gillis, S.; Henney, C. S.; Urdal, D. L. : The cell surface receptors for interleukin-1(alpha) and interleukin-1(beta) are identical. *Nature* 324: 266-268, 1986. ; and

[28363] Sims, J. E.; Acres, R. B.; Grubin, C. E.; McMahan, C. J.; Wignall, J. M.; March, C. J.; Dower, S. K. : Cloning the interleukin 1 receptor from human T cells. *Proc. Nat. Acad. Sci.* 86: 89.

[28364] Further studies establishing the function and utilities of IL1R1 are found in John Hopkins OMIM database record ID

147810, and in cited publications numbered 3041–3044 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Phosphodiesterase 4D, CAMP-specific (phosphodiesterase E3 duncce homolog, *Drosophila*) (PDE4D, Accession XM\_056815) is another VGAM704 host target gene. PDE4D BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PDE4D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDE4D BINDING SITE, designated SEQ ID:36430, to the nucleotide sequence of VGAM704 RNA, herein designated VGAM RNA, also designated SEQ ID:3415.

[28365] Another function of VGAM704 is therefore inhibition of Phosphodiesterase 4D, CAMP-specific (phosphodiesterase E3 duncce homolog, *Drosophila*) (PDE4D, Accession XM\_056815), a gene which has similarity to *Drosophila* dnc, which is the affected protein in learning and memory mutant duncce. Accordingly, utilities of VGAM704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE4D. The function of PDE4D and its association with various diseases and clinical

cal conditions, has been established by previous studies, as described hereinabove with reference to VGAM180.Sarcoma Amplified Sequence (SAS, Accession NM\_005981) is another VGAM704 host target gene. SAS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SAS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SAS BINDING SITE, designated SEQ ID:12605, to the nucleotide sequence of VGAM704 RNA, herein designated VGAM RNA, also designated SEQ ID:3415.

[28366] Another function of VGAM704 is therefore inhibition of Sarcoma Amplified Sequence (SAS, Accession NM\_005981), a gene which is a member of the transmembrane 4 superfamily (TM4SF) and may be involved in growth-related cellular processes T. Accordingly, utilities of VGAM704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SAS. The function of SAS has been established by previous studies. SAS is a member of the transmembrane 4 superfamily, all members of which have 4 hydrophobic domains. This family includes various tumor-associated

antigens such as CO-029 (OMIM Ref. No. 600769), L6 (M3S1; 191155), and ME491 (CD63; 155740), hematopoietic cell antigens such as CD9 (OMIM Ref. No. 143030), CD53 (OMIM Ref. No. 151525), CD37 (OMIM Ref. No. 151523), and TAPA1 (OMIM Ref. No. 186845), as well as the parasitic trematode surface proteins Sm23 and Sj23. Meltzer et al. (1991) identified and partially cloned a gene that is amplified in human malignant fibrous histiocytoma. They demonstrated that the gene, designated sarcoma amplified sequence, is located on chromosome 12 by hybridization to a rodent/human somatic cell hybrid mapping panel. They further regionalized the assignment to 12q13-q14 by fluorescence in situ hybridization. This chromosomal region is commonly involved in rearrangements in myxoid liposarcoma, benign lipoma, and uterine leiomyoma. Meltzer et al. (1991) identified SAS amplification in 5 of 29 malignant fibrous histiocytoma biopsies, 4 of 12 liposarcoma biopsies, and 1 osteogenic sarcoma cell line. Since amplification of cellular oncogenes occurs frequently in human cancers, identification of amplified genes in tumor cells is a useful approach for understanding genetic alterations. Jankowski et al. (1995) characterized the genomic structure of SAS and showed that it has

6 exons spanning approximately 3.2 kb.

[28367] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[28368] Jankowski, S. A.; De Jong, P.; Meltzer, P. S. : Genomic structure of SAS, a member of the transmembrane 4 superfamily amplified in human sarcomas. *Genomics* 25: 501–506, 1995. ; and

[28369] Meltzer, P. S.; Jankowski, S. A.; Dal Cin, P.; Sandberg, A. A.; Paz, I. B.; Coccia, M. A.; Smith, S. H. : Identification and cloning of a novel amplified DNA sequence in human malignant.

[28370] Further studies establishing the function and utilities of SAS are found in John Hopkins OMIM database record ID 181035, and in cited publications numbered 5704–5705 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Transcription Factor 7 (T-cell specific, HMG-box) (TCF7, Accession NM\_003202) is another VGAM704 host target gene. TCF7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TCF7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of TCF7 BINDING SITE, designated SEQ ID:9190, to the nucleotide sequence of VGAM704 RNA, herein designated VGAM RNA, also designated SEQ ID:3415.

[28371] Another function of VGAM704 is therefore inhibition of Transcription Factor 7 (T-cell specific, HMG-box) (TCF7, Accession NM\_003202). Accordingly, utilities of VGAM704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCF7. Adaptor-related Protein Complex 3, Mu 2 Subunit (AP3M2, Accession NM\_006803) is another VGAM704 host target gene.

AP3M2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AP3M2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AP3M2 BINDING SITE, designated SEQ ID:13675, to the nucleotide sequence of VGAM704 RNA, herein designated VGAM RNA, also designated SEQ ID:3415.

[28372] Another function of VGAM704 is therefore inhibition of Adaptor-related Protein Complex 3, Mu 2 Subunit (AP3M2, Accession NM\_006803). Accordingly, utilities of

VGAM704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP3M2. DKFZP564I1171 (Accession XM\_049568) is another VGAM704 host target gene. DKFZP564I1171 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP564I1171, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564I1171 BINDING SITE, designated SEQ ID:35444, to the nucleotide sequence of VGAM704 RNA, herein designated VGAM RNA, also designated SEQ ID:3415.

[28373] Another function of VGAM704 is therefore inhibition of DKFZP564I1171 (Accession XM\_049568). Accordingly, utilities of VGAM704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564I1171. KIAA0433 (Accession NM\_015216) is another VGAM704 host target gene. KIAA0433 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0433, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA0433 BINDING SITE, designated SEQ ID:17547, to the nucleotide sequence of VGAM704 RNA, herein designated VGAM RNA, also designated SEQ ID:3415.

[28374] Another function of VGAM704 is therefore inhibition of KIAA0433 (Accession NM\_015216). Accordingly, utilities of VGAM704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0433. KIAA0557 (Accession XM\_085507) is another VGAM704 host target gene. KIAA0557 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0557, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0557 BINDING SITE, designated SEQ ID:38206, to the nucleotide sequence of VGAM704 RNA, herein designated VGAM RNA, also designated SEQ ID:3415.

[28375] Another function of VGAM704 is therefore inhibition of KIAA0557 (Accession XM\_085507). Accordingly, utilities of VGAM704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0557. KIAA1350 (Accession XM\_052597) is another VGAM704 host target gene. KIAA1350 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1350, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1350 BINDING SITE, designated SEQ ID:36000, to the nucleotide sequence of VGAM704 RNA, herein designated VGAM RNA, also designated SEQ ID:3415.

[28376] Another function of VGAM704 is therefore inhibition of KIAA1350 (Accession XM\_052597). Accordingly, utilities of VGAM704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1350. KIAA1557 (Accession XM\_028289) is another VGAM704 host target gene. KIAA1557 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1557, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1557 BINDING SITE, designated SEQ ID:30640, to the nucleotide sequence of VGAM704 RNA, herein designated VGAM RNA, also designated SEQ ID:3415.

[28377] Another function of VGAM704 is therefore inhibition of

KIAA1557 (Accession XM\_028289). Accordingly, utilities of VGAM704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1557. KIAA1735 (Accession XM\_113686) is another VGAM704 host target gene. KIAA1735 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1735, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1735 BINDING SITE, designated SEQ ID:42345, to the nucleotide sequence of VGAM704 RNA, herein designated VGAM RNA, also designated SEQ ID:3415.

[28378] Another function of VGAM704 is therefore inhibition of KIAA1735 (Accession XM\_113686). Accordingly, utilities of VGAM704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1735. MGC5466 (Accession XM\_054436) is another VGAM704 host target gene. MGC5466 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC5466, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of MGC5466 BINDING SITE, designated SEQ ID:36158, to the nucleotide sequence of VGAM704 RNA, herein designated VGAM RNA, also designated SEQ ID:3415.

[28379] Another function of VGAM704 is therefore inhibition of MGC5466 (Accession XM\_054436). Accordingly, utilities of VGAM704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC5466. Retinoic Acid Induced 17 (RAI17, Accession XM\_166091) is another VGAM704 host target gene. RAI17 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAI17, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAI17 BINDING SITE, designated SEQ ID:43861, to the nucleotide sequence of VGAM704 RNA, herein designated VGAM RNA, also designated SEQ ID:3415.

[28380] Another function of VGAM704 is therefore inhibition of Retinoic Acid Induced 17 (RAI17, Accession XM\_166091). Accordingly, utilities of VGAM704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAI17. Spi-B Transcription Factor

(Spi-1/PU.1 related) (SPIB, Accession NM\_003121) is another VGAM704 host target gene. SPIB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SPIB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPIB BINDING SITE, designated SEQ ID:9092, to the nucleotide sequence of VGAM704 RNA, herein designated VGAM RNA, also designated SEQ ID:3415.

[28381] Another function of VGAM704 is therefore inhibition of Spi-B Transcription Factor (Spi-1/PU.1 related) (SPIB, Accession NM\_003121). Accordingly, utilities of VGAM704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPIB. Sperm Specific Antigen 2 (SSFA2, Accession XM\_057458) is another VGAM704 host target gene. SSFA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SSFA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SSFA2 BINDING SITE, designated SEQ ID:36514, to the nucleotide sequence of

VGAM704 RNA, herein designated VGAM RNA, also designated SEQ ID:3415.

[28382] Another function of VGAM704 is therefore inhibition of Sperm Specific Antigen 2 (SSFA2, Accession XM\_057458). Accordingly, utilities of VGAM704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SSFA2. SSH-3 (Accession NM\_017857) is another VGAM704 host target gene. SSH-3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SSH-3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SSH-3 BINDING SITE, designated SEQ ID:19535, to the nucleotide sequence of VGAM704 RNA, herein designated VGAM RNA, also designated SEQ ID:3415.

[28383] Another function of VGAM704 is therefore inhibition of SSH-3 (Accession NM\_017857). Accordingly, utilities of VGAM704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SSH-3. LOC153474 (Accession XM\_087684) is another VGAM704 host target gene. LOC153474 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of

mRNA encoded by LOC153474, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153474 BINDING SITE, designated SEQ ID:39380, to the nucleotide sequence of VGAM704 RNA, herein designated VGAM RNA, also designated SEQ ID:3415.

[28384] Another function of VGAM704 is therefore inhibition of LOC153474 (Accession XM\_087684). Accordingly, utilities of VGAM704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153474. LOC200734 (Accession XM\_114286) is another VGAM704 host target gene. LOC200734 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200734, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200734 BINDING SITE, designated SEQ ID:42839, to the nucleotide sequence of VGAM704 RNA, herein designated VGAM RNA, also designated SEQ ID:3415.

[28385] Another function of VGAM704 is therefore inhibition of LOC200734 (Accession XM\_114286). Accordingly, utilities

of VGAM704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200734. LOC202347 (Accession XM\_117390) is another VGAM704 host target gene. LOC202347 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC202347, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202347 BINDING SITE, designated SEQ ID:43429, to the nucleotide sequence of VGAM704 RNA, herein designated VGAM RNA, also designated SEQ ID:3415.

[28386] Another function of VGAM704 is therefore inhibition of LOC202347 (Accession XM\_117390). Accordingly, utilities of VGAM704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202347. LOC89919 (Accession XM\_027244) is another VGAM704 host target gene. LOC89919 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC89919, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC89919 BINDING SITE, designated SEQ ID:30463, to the nucleotide sequence of VGAM704 RNA, herein designated VGAM RNA, also designated SEQ ID:3415.

[28387] Another function of VGAM704 is therefore inhibition of LOC89919 (Accession XM\_027244). Accordingly, utilities of VGAM704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC89919. LOC93550 (Accession XM\_051999) is another VGAM704 host target gene. LOC93550 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC93550, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93550 BINDING SITE, designated SEQ ID:35930, to the nucleotide sequence of VGAM704 RNA, herein designated VGAM RNA, also designated SEQ ID:3415.

[28388] Another function of VGAM704 is therefore inhibition of LOC93550 (Accession XM\_051999). Accordingly, utilities of VGAM704 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93550. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 705 (VGAM705) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28389] VGAM705 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM705 was detected is described hereinabove with reference to Figs. 1–8.

[28390] VGAM705 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Coronavirus 229E. VGAM705 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28391] VGAM705 gene encodes a VGAM705 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM705 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM705 precursor RNA is designated SEQ ID:691, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:691 is located at position 23467 relative to the genome of Hu–

man Coronavirus 229E.

[28392] VGAM705 precursor RNA folds onto itself, forming VGAM705 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28393] An enzyme complex designated DICER COMPLEX, `dices` the VGAM705 folded precursor RNA into VGAM705 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM705 RNA is designated SEQ ID:3416, and is provided hereinbelow with reference to the sequence listing part.

[28394] VGAM705 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM705 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM705 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[28395] VGAM705 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM705 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM705 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM705 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM705 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[28396] The complementary binding of VGAM705 RNA, herein designated VGAM RNA, to host target binding sites on VGAM705 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM705 host target RNA into VGAM705 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28397] It is appreciated that VGAM705 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM705 host target genes. The mRNA of each one of this plurality of VGAM705 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM705 RNA, herein designated VGAM RNA, and which when bound by VGAM705 RNA causes inhibition of translation of respective one or more VGAM705 host target proteins.

[28398] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM705 gene, herein designated VGAM GENE, on one or more VGAM705 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[28399] It is yet further appreciated that a function of VGAM705 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM705 include diagnosis, prevention and treatment of viral infection by Human Coronavirus 229E. Specific functions, and accordingly utilities, of VGAM705

correlate with, and may be deduced from, the identity of the host target genes which VGAM705 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28400] Nucleotide sequences of the VGAM705 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM705 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM705 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM705 are further described hereinbelow with reference to Table 1.

[28401] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM705 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM705 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28402] As mentioned hereinabove with reference to Fig. 1, a function of VGAM705 gene, herein designated VGAM is inhibition of expression of VGAM705 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM705 correlate with, and may be deduced

from, the identity of the target genes which VGAM705 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28403] Aldehyde Dehydrogenase 1 Family, Member A3 (ALDH1A3, Accession NM\_000693) is a VGAM705 host target gene. ALDH1A3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ALDH1A3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALDH1A3 BINDING SITE, designated SEQ ID:6351, to the nucleotide sequence of VGAM705 RNA, herein designated VGAM RNA, also designated SEQ ID:3416.

[28404] A function of VGAM705 is therefore inhibition of Aldehyde Dehydrogenase 1 Family, Member A3 (ALDH1A3, Accession NM\_000693), a gene which plays a major role in the detoxification of aldehydes generated by alcohol metabolism and lipid peroxidation. Accordingly, utilities of VGAM705 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALDH1A3. The function of ALDH1A3 and its association with various diseases and clinical conditions, has been es-

established by previous studies, as described hereinabove with reference to VGAM565. Chromosome 9 Open Reading Frame 9 (C9orf9, Accession NM\_018956) is another VGAM705 host target gene. C9orf9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C9orf9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C9orf9 BINDING SITE, designated SEQ ID:21025, to the nucleotide sequence of VGAM705 RNA, herein designated VGAM RNA, also designated SEQ ID:3416.

[28405] Another function of VGAM705 is therefore inhibition of Chromosome 9 Open Reading Frame 9 (C9orf9, Accession NM\_018956). Accordingly, utilities of VGAM705 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C9orf9. DKFZP727C091 (Accession XM\_038689) is another VGAM705 host target gene. DKFZP727C091 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP727C091, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of DKFZP727C091 BINDING SITE, designated SEQ ID:32909, to the nucleotide sequence of VGAM705 RNA, herein designated VGAM RNA, also designated SEQ ID:3416.

[28406] Another function of VGAM705 is therefore inhibition of DKFZP727C091 (Accession XM\_038689). Accordingly, utilities of VGAM705 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP727C091. Endothelial Cell-specific Molecule 1 (ESM1, Accession NM\_007036) is another VGAM705 host target gene. ESM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ESM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ESM1 BINDING SITE, designated SEQ ID:13916, to the nucleotide sequence of VGAM705 RNA, herein designated VGAM RNA, also designated SEQ ID:3416.

[28407] Another function of VGAM705 is therefore inhibition of Endothelial Cell-specific Molecule 1 (ESM1, Accession NM\_007036). Accordingly, utilities of VGAM705 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with ESM1. F-box Only Protein 4 (FBXO4, Accession NM\_033484) is another VGAM705 host target gene. FBXO4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FBXO4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBXO4 BINDING SITE, designated SEQ ID:27263, to the nucleotide sequence of VGAM705 RNA, herein designated VGAM RNA, also designated SEQ ID:3416.

[28408] Another function of VGAM705 is therefore inhibition of F-box Only Protein 4 (FBXO4, Accession NM\_033484). Accordingly, utilities of VGAM705 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXO4. FLJ11273 (Accession NM\_018374) is another VGAM705 host target gene. FLJ11273 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11273, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11273 BINDING SITE, designated SEQ ID:20396, to the

nucleotide sequence of VGAM705 RNA, herein designated VGAM RNA, also designated SEQ ID:3416.

[28409] Another function of VGAM705 is therefore inhibition of FLJ11273 (Accession NM\_018374). Accordingly, utilities of VGAM705 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11273. FLJ21916 (Accession NM\_023112) is another VGAM705 host target gene. FLJ21916 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21916, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21916 BINDING SITE, designated SEQ ID:23382, to the nucleotide sequence of VGAM705 RNA, herein designated VGAM RNA, also designated SEQ ID:3416.

[28410] Another function of VGAM705 is therefore inhibition of FLJ21916 (Accession NM\_023112). Accordingly, utilities of VGAM705 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21916. Lipoma HMGIC Fusion Partner-like 2 (LHFPL2, Accession XM\_046054) is another VGAM705 host target gene. LHFPL2 BINDING SITE is HOST TARGET binding site found

in the 3' untranslated region of mRNA encoded by LHFPL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LHFPL2 BINDING SITE, designated SEQ ID:34662, to the nucleotide sequence of VGAM705 RNA, herein designated VGAM RNA, also designated SEQ ID:3416.

[28411] Another function of VGAM705 is therefore inhibition of Lipoma HMGIC Fusion Partner-like 2 (LHFPL2, Accession XM\_046054). Accordingly, utilities of VGAM705 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LHFPL2. Seizure Related 6 Homolog (mouse) (SEZ6, Accession XM\_058869) is another VGAM705 host target gene. SEZ6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SEZ6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEZ6 BINDING SITE, designated SEQ ID:36776, to the nucleotide sequence of VGAM705 RNA, herein designated VGAM RNA, also designated SEQ ID:3416.

[28412] Another function of VGAM705 is therefore inhibition of Seizure Related 6 Homolog (mouse) (SEZ6, Accession XM\_058869). Accordingly, utilities of VGAM705 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEZ6. Sialyltransferase 8C (alpha2,3Galbeta1,4GlcNAcalpha 2,8-sialyltransferase) (SIAT8C, Accession NM\_015879) is another VGAM705 host target gene. SIAT8C BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SIAT8C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIAT8C BINDING SITE, designated SEQ ID:18028, to the nucleotide sequence of VGAM705 RNA, herein designated VGAM RNA, also designated SEQ ID:3416.

[28413] Another function of VGAM705 is therefore inhibition of Sialyltransferase 8C (alpha2,3Galbeta1,4GlcNAcalpha 2,8-sialyltransferase) (SIAT8C, Accession NM\_015879). Accordingly, utilities of VGAM705 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIAT8C. LOC163255 (Accession XM\_092121) is another VGAM705 host target gene.

LOC163255 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC163255, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163255 BINDING SITE, designated SEQ ID:40107, to the nucleotide sequence of VGAM705 RNA, herein designated VGAM RNA, also designated SEQ ID:3416.

[28414] Another function of VGAM705 is therefore inhibition of LOC163255 (Accession XM\_092121). Accordingly, utilities of VGAM705 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163255. LOC164397 (Accession XM\_092780) is another VGAM705 host target gene. LOC164397 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC164397, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC164397 BINDING SITE, designated SEQ ID:40149, to the nucleotide sequence of VGAM705 RNA, herein designated VGAM RNA, also designated SEQ ID:3416.

[28415] Another function of VGAM705 is therefore inhibition of LOC164397 (Accession XM\_092780). Accordingly, utilities of VGAM705 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC164397. LOC255862 (Accession XM\_170505) is another VGAM705 host target gene. LOC255862 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255862, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255862 BINDING SITE, designated SEQ ID:45341, to the nucleotide sequence of VGAM705 RNA, herein designated VGAM RNA, also designated SEQ ID:3416.

[28416] Another function of VGAM705 is therefore inhibition of LOC255862 (Accession XM\_170505). Accordingly, utilities of VGAM705 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255862. LOC256176 (Accession XM\_172889) is another VGAM705 host target gene. LOC256176 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256176, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256176 BINDING SITE, designated SEQ ID:46171, to the nucleotide sequence of VGAM705 RNA, herein designated VGAM RNA, also designated SEQ ID:3416.

[28417] Another function of VGAM705 is therefore inhibition of LOC256176 (Accession XM\_172889). Accordingly, utilities of VGAM705 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256176. LOC91050 (Accession XM\_035703) is another VGAM705 host target gene. LOC91050 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91050, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91050 BINDING SITE, designated SEQ ID:32338, to the nucleotide sequence of VGAM705 RNA, herein designated VGAM RNA, also designated SEQ ID:3416.

[28418] Another function of VGAM705 is therefore inhibition of LOC91050 (Accession XM\_035703). Accordingly, utilities of VGAM705 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC91050. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 706 (VGAM706) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28419] VGAM706 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM706 was detected is described hereinabove with reference to Figs. 1–8.

[28420] VGAM706 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Coronavirus 229E. VGAM706 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28421] VGAM706 gene encodes a VGAM706 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM706 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM706 precursor RNA is designated SEQ ID:692, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:692 is located at position 23583 relative to the genome of Human Coronavirus 229E.

[28422] VGAM706 precursor RNA folds onto itself, forming VGAM706 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28423] An enzyme complex designated DICER COMPLEX, `dices` the VGAM706 folded precursor RNA into VGAM706 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM706 RNA is designated SEQ ID:3417, and is provided hereinbelow with reference to the sequence listing part.

[28424] VGAM706 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM706 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM706 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[28425] VGAM706 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM706 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM706 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM706 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM706 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[28426] The complementary binding of VGAM706 RNA, herein designated VGAM RNA, to host target binding sites on VGAM706 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM706 host target RNA into VGAM706 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28427] It is appreciated that VGAM706 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM706 host target genes. The mRNA of each one of this plurality of VGAM706 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM706 RNA, herein designated VGAM RNA, and which when bound by VGAM706 RNA causes in-

hibition of translation of respective one or more VGAM706 host target proteins.

[28428] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM706 gene, herein designated VGAM GENE, on one or more VGAM706 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[28429] It is yet further appreciated that a function of VGAM706 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM706 include diagnosis, prevention and

treatment of viral infection by Human Coronavirus 229E. Specific functions, and accordingly utilities, of VGAM706 correlate with, and may be deduced from, the identity of the host target genes which VGAM706 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [28430] Nucleotide sequences of the VGAM706 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM706 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM706 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM706 are further described hereinbelow with reference to Table 1.
- [28431] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM706 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM706 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [28432] As mentioned hereinabove with reference to Fig. 1, a function of VGAM706 gene, herein designated VGAM is inhibition of expression of VGAM706 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM706 correlate with, and may be deduced from, the identity of the target genes which VGAM706 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28433] A Disintegrin and Metalloproteinase Domain 10 (ADAM10, Accession NM\_001110) is a VGAM706 host target gene. ADAM10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADAM10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAM10 BINDING SITE, designated SEQ ID:6769, to the nucleotide sequence of VGAM706 RNA, herein designated VGAM RNA, also designated SEQ ID:3417.

[28434] A function of VGAM706 is therefore inhibition of A Disintegrin and Metalloproteinase Domain 10 (ADAM10, Accession NM\_001110), a gene which Member of ADAM family of zinc metalloproteases. Accordingly, utilities of VGAM706 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAM10. The function of ADAM10 has been established by previous

studies. Wolfsberg et al. (1995) identified a family of proteins containing a disintegrin and metalloproteinase (ADAM) domain. Members of this family are cell surface proteins with a unique structure possessing both potential adhesion and protease domains. Tumor necrosis factor- $\alpha$  (TNFA; 191160) is synthesized as a proinflammatory cytokine from a 233-amino acid precursor. Conversion of the membrane-bound precursor to a secreted mature protein is mediated by a protease termed TNFA convertase. Lunn et al. (1997) found that ADAM10 possesses TNFA convertase activity. TNFA is involved in a variety of diseases. To elucidate whether the ADAM10 locus maps to the same region as a disease susceptibility, Yamazaki et al. (1997) mapped the ADAM10 locus. Using a radiation hybrid mapping method, they showed that ADAM10 is located on 15q21.3-q23. Although ephrins form a high-affinity multivalent complex with their receptors present on axons, axons can be rapidly repelled rather than being bound. Hattori et al. (2000) showed that ephrin-A2 (OMIM Ref. No. 602756) forms a stable complex with the metalloproteinase Kuzbanian (OMIM Ref. No. ADAM10) involving interactions outside the cleavage region and the protease domain. Eph receptor binding triggered ephrin-A2

cleavage in a localized reaction specific to the cognate ligand. The cleavage-inhibiting mutation in ephrin-A2 delayed axon withdrawal. Hattori et al. (2000) concluded that their studies reveal mechanisms for protease recognition and control of cell surface proteins, and, for ephrin-A2, they may provide a means for efficient axon detachment and termination of signaling.

[28435] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[28436] Lunn, C. A.; Fan, X.; Dalie, B.; Miller, K.; Zavodny, P. J.; Narula, S. K.; Lundell, D. : Purification of ADAM 10 from bovine spleen as a TNFalpha convertase. FEBS Lett. 400: 333-335, 1997. ; and

[28437] Hattori, M.; Osterfield, M.; Flanagan, J. G. : Regulated cleavage of a contact-mediated axon repellent. Science 289: 1360-1365, 2000.

[28438] Further studies establishing the function and utilities of ADAM10 are found in John Hopkins OMIM database record ID 602192, and in cited publications numbered 1267 and 5852-5853 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Zinc Finger, Imprinted 2 (ZIM2, Accession NM\_015363) is another

VGAM706 host target gene. ZIM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZIM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZIM2 BINDING SITE, designated SEQ ID:17664, to the nucleotide sequence of VGAM706 RNA, herein designated VGAM RNA, also designated SEQ ID:3417.

[28439] Another function of VGAM706 is therefore inhibition of Zinc Finger, Imprinted 2 (ZIM2, Accession NM\_015363). Accordingly, utilities of VGAM706 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZIM2. LOC221715 (Accession XM\_168092) is another VGAM706 host target gene. LOC221715 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221715, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221715 BINDING SITE, designated SEQ ID:45018, to the nucleotide sequence of VGAM706 RNA, herein designated VGAM RNA, also designated SEQ ID:3417.

[28440] Another function of VGAM706 is therefore inhibition of LOC221715 (Accession XM\_168092). Accordingly, utilities of VGAM706 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221715. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 707 (VGAM707) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28441] VGAM707 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM707 was detected is described hereinabove with reference to Figs. 1–8.

[28442] VGAM707 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Invertebrate Iridescent Virus 6. VGAM707 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28443] VGAM707 gene encodes a VGAM707 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM707

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM707 precursor RNA is designated SEQ ID:693, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:693 is located at position 129865 relative to the genome of Invertebrate Iridescent Virus 6.

[28444] VGAM707 precursor RNA folds onto itself, forming VGAM707 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28445] An enzyme complex designated DICER COMPLEX, `dices` the VGAM707 folded precursor RNA into VGAM707 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 84%) nucleotide sequence of VGAM707 RNA is designated SEQ ID:3418, and is provided hereinbelow with reference to the sequence listing part.

[28446] VGAM707 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM707 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM707 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[28447] VGAM707 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM707 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM707 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM707 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM707 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[28448] The complementary binding of VGAM707 RNA, herein designated VGAM RNA, to host target binding sites on VGAM707 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM707 host target RNA into VGAM707 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28449] It is appreciated that VGAM707 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM707 host target genes. The mRNA of each one of this plurality of VGAM707 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM707 RNA, herein designated VGAM RNA, and which when bound by VGAM707 RNA causes inhibition of translation of respective one or more VGAM707 host target proteins.

[28450] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM707 gene, herein designated VGAM GENE, on one or more VGAM707 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[28451] It is yet further appreciated that a function of VGAM707 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM707 include diagnosis, prevention and treatment of viral infection by Invertebrate Iridescent Virus 6. Specific functions, and accordingly utilities, of VGAM707 correlate with, and may be deduced from, the identity of the host target genes which VGAM707 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28452] Nucleotide sequences of the VGAM707 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM707 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM707 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM707 are further described hereinbelow with reference to Table 1.

[28453] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM707 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM707 RNA, herein designated VGAM RNA, are described hereinbelow with refer-

ence to Table 2.

[28454] As mentioned hereinabove with reference to Fig. 1, a function of VGAM707 gene, herein designated VGAM is inhibition of expression of VGAM707 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM707 correlate with, and may be deduced from, the identity of the target genes which VGAM707 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28455] Eyes Absent Homolog 4 (Drosophila) (EYA4, Accession NM\_004100) is a VGAM707 host target gene. EYA4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EYA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EYA4 BINDING SITE, designated SEQ ID:10308, to the nucleotide sequence of VGAM707 RNA, herein designated VGAM RNA, also designated SEQ ID:3418.

[28456] A function of VGAM707 is therefore inhibition of Eyes Absent Homolog 4 (Drosophila) (EYA4, Accession NM\_004100), a gene which may be involved in development of the eye (by similarity). Accordingly, utilities of

VGAM707 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EYA4. The function of EYA4 has been established by previous studies. Borsani et al. (1999) presented the detailed characterization of a fourth vertebrate gene, designated EYA4, that is homologous to 'eyes absent' (eya), a key regulator of ocular development in *Drosophila*. See also EYA1 (OMIM Ref. No. 601653), EYA2 (OMIM Ref. No. 601654), and EYA3 (OMIM Ref. No. 601655). The authors found that EYA4 encodes a 640-amino acid protein containing a highly conserved C-terminal domain of 271 amino acids. In *Drosophila*, eya is known to mediate developmentally important protein-protein interactions. By radiation hybrid analysis and fluorescence in situ hybridization, Borsani et al. (1999) mapped the human EYA4 gene to 6q23. They also detected linkage, with a lod score of greater than 3, to previously mapped reference markers. They genetically mapped the mouse Eya4 gene to chromosome 10 in the vicinity of Aco2 (OMIM Ref. No. 100850), in a region homologous to human chromosome 6q22-q23. In the developing mouse embryo, Eya4 was expressed primarily in the craniofacial mesenchyme, the dermamyotome, and the limb. On the basis of map position and expression pat-

tern, EYA4 was considered a candidate for oculodentodigital dysplasia (OMIM Ref. No. 164200), but Borsani et al. (1999) found no EYA4 mutations in a panel of patients with this disorder. Wayne et al. (2001) identified mutations in the EYA4 gene that were responsible for postlingual, progressive, autosomal dominant hearing loss at the DFNA10 locus (OMIM Ref. No. 601316). Just as EYA proteins interact with members of the SIX (OMIM Ref. No. 601205) and DACH (OMIM Ref. No. 603803) protein families during early embryonic development, the authors suggested that EYA4 is also important postdevelopmentally for continued function of the mature organ of Corti.

[28457] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[28458] Borsani, G.; DeGrandi, A.; Ballabio, A.; Bulfone, A.; Bernard, L.; Banfi, S.; Gattuso, C.; Mariani, M.; Dixon, M.; Donnai, D.; Metcalfe, K.; Winter, R.; Robertson, M.; Axton, R.; Brown, A.; van Heyningen, V.; Hanson, I. : EYA4, a novel vertebrate gene related to *Drosophila* eyes absent. Hum. Molec. Genet. 8: 11-23, 1999. ; and

[28459] Wayne, S.; Robertson, N. G.; DeClau, F.; Chen, N.; Verhoeven, K.; Prasad, S.; Tranebjarg, L.; Morton, C. C.; Ryan, A.

F.; Van Camp, G.; Smith, R. J. H. : Mutations in the transcriptiona.

[28460] Further studies establishing the function and utilities of EYA4 are found in John Hopkins OMIM database record ID 603550, and in cited publications numbered 494 and 9384 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. C20orf180 (Accession NM\_018431) is another VGAM707 host target gene. C20orf180 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf180, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf180 BINDING SITE, designated SEQ ID:20496, to the nucleotide sequence of VGAM707 RNA, herein designated VGAM RNA, also designated SEQ ID:3418.

[28461] Another function of VGAM707 is therefore inhibition of C20orf180 (Accession NM\_018431). Accordingly, utilities of VGAM707 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf180. LOC145474 (Accession XM\_085147) is another VGAM707 host target gene. LOC145474 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145474, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145474 BINDING SITE, designated SEQ ID:37870, to the nucleotide sequence of VGAM707 RNA, herein designated VGAM RNA, also designated SEQ ID:3418.

[28462] Another function of VGAM707 is therefore inhibition of LOC145474 (Accession XM\_085147). Accordingly, utilities of VGAM707 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145474. LOC146229 (Accession XM\_085387) is another VGAM707 host target gene. LOC146229 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146229, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146229 BINDING SITE, designated SEQ ID:38112, to the nucleotide sequence of VGAM707 RNA, herein designated VGAM RNA, also designated SEQ ID:3418.

[28463] Another function of VGAM707 is therefore inhibition of

LOC146229 (Accession XM\_085387). Accordingly, utilities of VGAM707 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146229. LOC158382 (Accession XM\_098931) is another VGAM707 host target gene. LOC158382 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158382, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158382 BINDING SITE, designated SEQ ID:41967, to the nucleotide sequence of VGAM707 RNA, herein designated VGAM RNA, also designated SEQ ID:3418.

[28464] Another function of VGAM707 is therefore inhibition of LOC158382 (Accession XM\_098931). Accordingly, utilities of VGAM707 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158382. LOC163255 (Accession XM\_092121) is another VGAM707 host target gene. LOC163255 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC163255, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC163255 BINDING SITE, designated SEQ ID:40108, to the nucleotide sequence of VGAM707 RNA, herein designated VGAM RNA, also designated SEQ ID:3418.

[28465] Another function of VGAM707 is therefore inhibition of LOC163255 (Accession XM\_092121). Accordingly, utilities of VGAM707 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163255. LOC200420 (Accession NM\_145300) is another VGAM707 host target gene. LOC200420 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200420, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200420 BINDING SITE, designated SEQ ID:29813, to the nucleotide sequence of VGAM707 RNA, herein designated VGAM RNA, also designated SEQ ID:3418.

[28466] Another function of VGAM707 is therefore inhibition of LOC200420 (Accession NM\_145300). Accordingly, utilities of VGAM707 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200420. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 708 (VGAM708) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28467] VGAM708 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM708 was detected is described hereinabove with reference to Figs. 1–8.

[28468] VGAM708 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Potato Virus V. VGAM708 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28469] VGAM708 gene encodes a VGAM708 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM708 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM708 precursor RNA is designated SEQ ID:694, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:694 is

located at position 9696 relative to the genome of Potato Virus V.

[28470] VGAM708 precursor RNA folds onto itself, forming VGAM708 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28471] An enzyme complex designated DICER COMPLEX, `dices` the VGAM708 folded precursor RNA into VGAM708 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM708 RNA is designated SEQ ID:3419, and is provided hereinbelow with reference to the sequence listing part.

[28472] VGAM708 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM708 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM708 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[28473] VGAM708 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM708 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM708 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM708 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM708 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[28474] The complementary binding of VGAM708 RNA, herein designated VGAM RNA, to host target binding sites on VGAM708 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM708 host target RNA into VGAM708 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28475] It is appreciated that VGAM708 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM708 host target genes. The mRNA of each one of this plurality of VGAM708 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM708 RNA, herein designated VGAM RNA, and which when bound by VGAM708 RNA causes inhibition of translation of respective one or more VGAM708

host target proteins.

[28476] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM708 gene, herein designated VGAM GENE, on one or more VGAM708 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[28477] It is yet further appreciated that a function of VGAM708 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM708 include diagnosis, prevention and treatment of viral infection by Potato Virus V. Specific

functions, and accordingly utilities, of VGAM708 correlate with, and may be deduced from, the identity of the host target genes which VGAM708 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28478] Nucleotide sequences of the VGAM708 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM708 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM708 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM708 are further described hereinbelow with reference to Table 1.

[28479] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM708 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM708 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28480] As mentioned hereinabove with reference to Fig. 1, a function of VGAM708 gene, herein designated VGAM is inhibition of expression of VGAM708 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM708 correlate with, and may be deduced from, the identity of the target genes which VGAM708 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28481] ATPase, Cu<sup>++</sup> Transporting, Beta Polypeptide (Wilson disease) (ATP7B, Accession NM\_000053) is a VGAM708 host target gene. ATP7B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP7B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP7B BINDING SITE, designated SEQ ID:5509, to the nucleotide sequence of VGAM708 RNA, herein designated VGAM RNA, also designated SEQ ID:3419.

[28482] A function of VGAM708 is therefore inhibition of ATPase, Cu<sup>++</sup> Transporting, Beta Polypeptide (Wilson disease) (ATP7B, Accession NM\_000053). Accordingly, utilities of VGAM708 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP7B. Egl Nine Homolog 2 (C. elegans) (EGLN2, Accession NM\_017555) is another VGAM708 host target gene. EGLN2 BINDING SITE is HOST TARGET binding site found

in the 3` untranslated region of mRNA encoded by EGLN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGLN2 BINDING SITE, designated SEQ ID:18990, to the nucleotide sequence of VGAM708 RNA, herein designated VGAM RNA, also designated SEQ ID:3419.

[28483] Another function of VGAM708 is therefore inhibition of Egl Nine Homolog 2 (*C. elegans*) (EGLN2, Accession NM\_017555), a gene which is an essential component of the pathway. Accordingly, utilities of VGAM708 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGLN2. The function of EGLN2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM432.NADH Dehydrogenase (ubiquinone) 1 Alpha Subcomplex, 5, 13kDa (NDUFA5, Accession NM\_005000) is another VGAM708 host target gene. NDUFA5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NDUFA5, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NDUFA5 BINDING SITE, designated SEQ ID:11443, to the nucleotide sequence of VGAM708 RNA, herein designated VGAM RNA, also designated SEQ ID:3419.

[28484] Another function of VGAM708 is therefore inhibition of NADH Dehydrogenase (ubiquinone) 1 Alpha Subcomplex, 5, 13kDa (NDUFA5, Accession NM\_005000), a gene which transfers electrons from nadh to the respiratory chain. Accordingly, utilities of VGAM708 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NDUFA5. The function of NDUFA5 has been established by previous studies. The multisubunit NADH:ubiquinone oxidoreductase (complex I) is the first enzyme complex in the electron transport chain of mitochondria. The iron-sulfur protein (IP) fraction of complex I is made up of 7 subunits, including B13. See NDUFS1 (OMIM Ref. No. 157655). By a combination of EST database screening and PCR, Pata et al. (1997) isolated cDNAs encoding the human homolog of bovine B13. The deduced 116-amino acid human protein has a calculated molecular weight of approximately 13 kD. Human and bovine B13 are 87% identical on the amino acid level.

Northern blot analysis revealed that the 1.6-kb B13 mRNA was expressed in all human tissues tested, with the highest levels in heart, skeletal muscle, and brain. Two additional smaller transcripts were also detected. Using Southern blots, Pata et al. (1997) determined that B13 is part of a multigene family in humans. During the course of a physical mapping project on 11p15.5, Russell et al. (1997) identified sequence with a high degree of similarity to the bovine NADH:ubiquinone oxidoreductase subunit B13. Following up on this lead, they isolated a clone with nucleotide sequence 88% and 83% identical over the predicted open reading frame with bovine and rat B13 subunit genes, respectively. The position of the initiation and termination codons was conserved. To determine the chromosomal localization of the B13 subunit gene, they screened a monochromosome somatic cell hybrid panel and showed that only the hybrid containing human chromosome 7 was positive.

[28485] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[28486] Pata, I.; Tensing, K.; Metspalu, A. : A human cDNA encoding the homologue of NADH:ubiquinone oxidoreductase

subunit B13. Biochim. Biophys. Acta 1350: 115–118, 1997. ; and

[28487] Russell, M. W.; du Manoir, S.; Collins, F. S.; Brody, L. C. : Cloning of the human NADH:ubiquinone oxidoreductase subunit B13: localization to chromosome 7q32 and identification of a ps.

[28488] Further studies establishing the function and utilities of NDUFA5 are found in John Hopkins OMIM database record ID 601677, and in cited publications numbered 6195–6196 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Syntaxin Binding Protein 1 (STXBP1, Accession NM\_003165) is another VGAM708 host target gene. STXBP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by STXBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STXBP1 BINDING SITE, designated SEQ ID:9142, to the nucleotide sequence of VGAM708 RNA, herein designated VGAM RNA, also designated SEQ ID:3419.

[28489] Another function of VGAM708 is therefore inhibition of Syntaxin Binding Protein 1 (STXBP1, Accession

NM\_003165), a gene which may play a role in determining the specificity of intracellular fusion reactions. Accordingly, utilities of VGAM708 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STXBP1. The function of STXBP1 has been established by previous studies. Within the secretory pathway, proteins and other cargo are transferred from one compartment to another by vesicular traffic. Transport vesicles bud from donor membranes and dock to specific acceptor compartments. The *S. cerevisiae* protein Sec1p participates in the constitutive secretory pathway between the Golgi apparatus and the plasma membrane. Pevsner et al. (1994) identified n-Sec1, a rat brain protein homologous to Sec1p. They found that n-Sec1 is a neural-specific, syntaxin (see OMIM Ref. No. 186590)-binding protein that may participate in the regulation of synaptic vesicle docking and fusion. Animal model experiments lend further support to the function of STXBP1. Verhage et al. (2000) abolished Munc18-1 in mice by homologous recombination. This resulted in a completely paralyzed organism. Null mutant embryos were alive until birth but died immediately after birth, probably because they could not breathe. Despite the general, complete, and permanent

loss of synaptic transmission in knockout mice, their brains were assembled correctly. Neuronal proliferation, migration, and differentiation into specific brain areas were unaffected. By embryonic day 12, brains from null mutant and control littermates were morphologically indistinguishable. At birth, late-forming brain areas such as the neocortex appeared identical in null mutant and control littermates. After initial brain assembly, extensive cell death of mature neurons was observed in null mutants, occurring first in lower brain areas that mature and form synapses relatively early. The degeneration in the mutant brains exhibited all characteristics of apoptosis. Ablation of Munc18-1 renders the brain synaptically silent, identifying Munc18-1 as the currently most upstream essential protein in neurotransmitter release. Verhage et al. (2000) concluded that synaptic connectivity does not depend on neurotransmitter secretion, but its maintenance does. Neurotransmitter secretion probably functions to validate already established synaptic connections.

[28490] It is appreciated that the abovementioned animal model for STXBP1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[28491] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[28492] Pevsner, J.; Hsu, S.-C.; Scheller, R. H. : n-Sec1: a neural-specific syntaxin-binding protein. Proc. Nat. Acad. Sci. 91: 1445-1449, 1994. ; and

[28493] Verhage, M.; Mala, A. S.; Plomp, J. J.; Brussaard, A. B.; Heeroma, J. H.; Vermeer, H.; Toonen, R. F.; Hammer, R. E.; van den Berg, T. K.; Missler, M.; Geuze, H. J.; Sudhof, T. C. : Synap.

[28494] Further studies establishing the function and utilities of STXBP1 are found in John Hopkins OMIM database record ID 602926, and in cited publications numbered 176 and 7747-7750 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. DKFZp434M0331 (Accession NM\_017600) is another VGAM708 host target gene. DKFZp434M0331 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZp434M0331, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434M0331 BINDING SITE, designated

SEQ ID:19075, to the nucleotide sequence of VGAM708 RNA, herein designated VGAM RNA, also designated SEQ ID:3419.

[28495] Another function of VGAM708 is therefore inhibition of DKFZp434M0331 (Accession NM\_017600). Accordingly, utilities of VGAM708 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434M0331. DKFZP547E2110 (Accession XM\_165676) is another VGAM708 host target gene. DKFZP547E2110 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP547E2110, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP547E2110 BINDING SITE, designated SEQ ID:43733, to the nucleotide sequence of VGAM708 RNA, herein designated VGAM RNA, also designated SEQ ID:3419.

[28496] Another function of VGAM708 is therefore inhibition of DKFZP547E2110 (Accession XM\_165676). Accordingly, utilities of VGAM708 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP547E2110. DRIL2 (Accession NM\_006465) is

another VGAM708 host target gene. DRIL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DRIL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DRIL2 BINDING SITE, designated SEQ ID:13193, to the nucleotide sequence of VGAM708 RNA, herein designated VGAM RNA, also designated SEQ ID:3419.

[28497] Another function of VGAM708 is therefore inhibition of DRIL2 (Accession NM\_006465). Accordingly, utilities of VGAM708 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DRIL2. FLJ12671 (Accession NM\_030980) is another VGAM708 host target gene. FLJ12671 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ12671, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12671 BINDING SITE, designated SEQ ID:25243, to the nucleotide sequence of VGAM708 RNA, herein designated VGAM RNA, also designated SEQ ID:3419.

[28498] Another function of VGAM708 is therefore inhibition of FLJ12671 (Accession NM\_030980). Accordingly, utilities of VGAM708 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12671. FLJ12891 (Accession NM\_024950) is another VGAM708 host target gene. FLJ12891 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12891, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12891 BINDING SITE, designated SEQ ID:24511, to the nucleotide sequence of VGAM708 RNA, herein designated VGAM RNA, also designated SEQ ID:3419.

[28499] Another function of VGAM708 is therefore inhibition of FLJ12891 (Accession NM\_024950). Accordingly, utilities of VGAM708 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12891. H2A Histone Family, Member J (H2AFJ, Accession NM\_018267) is another VGAM708 host target gene. H2AFJ BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by H2AFJ, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of H2AFJ BINDING SITE, designated SEQ ID:20238, to the nucleotide sequence of VGAM708 RNA, herein designated VGAM RNA, also designated SEQ ID:3419.

[28500] Another function of VGAM708 is therefore inhibition of H2A Histone Family, Member J (H2AFJ, Accession NM\_018267). Accordingly, utilities of VGAM708 include diagnosis, prevention and treatment of diseases and clinical conditions associated with H2AFJ. KIAA0261 (Accession XM\_042946) is another VGAM708 host target gene. KIAA0261 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0261, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0261 BINDING SITE, designated SEQ ID:33836, to the nucleotide sequence of VGAM708 RNA, herein designated VGAM RNA, also designated SEQ ID:3419.

[28501] Another function of VGAM708 is therefore inhibition of KIAA0261 (Accession XM\_042946). Accordingly, utilities of VGAM708 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA0261. KIAA1045 (Accession XM\_048592) is another VGAM708 host target gene. KIAA1045 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1045, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1045 BINDING SITE, designated SEQ ID:35202, to the nucleotide sequence of VGAM708 RNA, herein designated VGAM RNA, also designated SEQ ID:3419.

[28502] Another function of VGAM708 is therefore inhibition of KIAA1045 (Accession XM\_048592). Accordingly, utilities of VGAM708 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1045. KIAA1432 (Accession XM\_039698) is another VGAM708 host target gene. KIAA1432 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1432, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1432 BINDING SITE, designated SEQ ID:33154, to the

nucleotide sequence of VGAM708 RNA, herein designated VGAM RNA, also designated SEQ ID:3419.

[28503] Another function of VGAM708 is therefore inhibition of KIAA1432 (Accession XM\_039698). Accordingly, utilities of VGAM708 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1432. MGC11034 (Accession NM\_031453) is another VGAM708 host target gene. MGC11034 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC11034, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC11034 BINDING SITE, designated SEQ ID:25473, to the nucleotide sequence of VGAM708 RNA, herein designated VGAM RNA, also designated SEQ ID:3419.

[28504] Another function of VGAM708 is therefore inhibition of MGC11034 (Accession NM\_031453). Accordingly, utilities of VGAM708 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC11034. RA-GEF-2 (Accession NM\_016340) is another VGAM708 host target gene. RA-GEF-2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by RA-GEF-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RA-GEF-2 BINDING SITE, designated SEQ ID:18466, to the nucleotide sequence of VGAM708 RNA, herein designated VGAM RNA, also designated SEQ ID:3419.

[28505] Another function of VGAM708 is therefore inhibition of RA-GEF-2 (Accession NM\_016340). Accordingly, utilities of VGAM708 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RA-GEF-2. LOC145844 (Accession XM\_085255) is another VGAM708 host target gene. LOC145844 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145844, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145844 BINDING SITE, designated SEQ ID:38000, to the nucleotide sequence of VGAM708 RNA, herein designated VGAM RNA, also designated SEQ ID:3419.

[28506] Another function of VGAM708 is therefore inhibition of LOC145844 (Accession XM\_085255). Accordingly, utilities

of VGAM708 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145844. LOC147180 (Accession XM\_097207) is another VGAM708 host target gene. LOC147180 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147180, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147180 BINDING SITE, designated SEQ ID:40819, to the nucleotide sequence of VGAM708 RNA, herein designated VGAM RNA, also designated SEQ ID:3419.

[28507] Another function of VGAM708 is therefore inhibition of LOC147180 (Accession XM\_097207). Accordingly, utilities of VGAM708 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147180. LOC150933 (Accession XM\_097971) is another VGAM708 host target gene. LOC150933 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150933, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC150933 BINDING SITE, designated SEQ ID:41274, to the nucleotide sequence of VGAM708 RNA, herein designated VGAM RNA, also designated SEQ ID:3419.

[28508] Another function of VGAM708 is therefore inhibition of LOC150933 (Accession XM\_097971). Accordingly, utilities of VGAM708 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150933. LOC157450 (Accession XM\_048209) is another VGAM708 host target gene. LOC157450 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157450, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157450 BINDING SITE, designated SEQ ID:35149, to the nucleotide sequence of VGAM708 RNA, herein designated VGAM RNA, also designated SEQ ID:3419.

[28509] Another function of VGAM708 is therefore inhibition of LOC157450 (Accession XM\_048209). Accordingly, utilities of VGAM708 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157450. LOC221486 (Accession XM\_165760) is another VGAM708 host target gene. LOC221486 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221486, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221486 BINDING SITE, designated SEQ ID:43747, to the nucleotide sequence of VGAM708 RNA, herein designated VGAM RNA, also designated SEQ ID:3419.

[28510] Another function of VGAM708 is therefore inhibition of LOC221486 (Accession XM\_165760). Accordingly, utilities of VGAM708 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221486. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 709 (VGAM709) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28511] VGAM709 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM709 was detected is described hereinabove with reference to Figs. 1-8.

[28512] VGAM709 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Helicoverpa Armigera Nuclear Polyhedrosis Virus. VGAM709 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28513] VGAM709 gene encodes a VGAM709 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM709 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM709 precursor RNA is designated SEQ ID:695, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:695 is located at position 70255 relative to the genome of Helicoverpa Armigera Nuclear Polyhedrosis Virus.

[28514] VGAM709 precursor RNA folds onto itself, forming VGAM709 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nu-

cleotide sequence of the second half thereof.

[28515] An enzyme complex designated DICER COMPLEX, `dices` the VGAM709 folded precursor RNA into VGAM709 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM709 RNA is designated SEQ ID:3420, and is provided hereinbelow with reference to the sequence listing part.

[28516] VGAM709 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM709 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM709 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[28517] VGAM709 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM709 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM709 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM709 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM709 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[28518] The complementary binding of VGAM709 RNA, herein designated VGAM RNA, to host target binding sites on VGAM709 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM709 host target RNA into VGAM709 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28519] It is appreciated that VGAM709 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM709 host target genes. The mRNA of each one of this plurality of VGAM709 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM709 RNA, herein designated VGAM RNA, and which when bound by VGAM709 RNA causes inhibition of translation of respective one or more VGAM709 host target proteins.

[28520] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM709 gene, herein designated VGAM GENE, on one or more VGAM709 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[28521] It is yet further appreciated that a function of VGAM709 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM709 include diagnosis, prevention and treatment of viral infection by Helicoverpa Armigera Nuclear Polyhedrosis Virus. Specific functions, and accordingly utilities, of VGAM709 correlate with, and may be deduced from, the identity of the host target genes which VGAM709 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28522] Nucleotide sequences of the VGAM709 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM709 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM709 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM709 are further described hereinbelow with reference to Table 1.

[28523] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM709 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM709 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28524] As mentioned hereinabove with reference to Fig. 1, a function of VGAM709 gene, herein designated VGAM is inhibition of expression of VGAM709 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM709 correlate with, and may be deduced from, the identity of the target genes which VGAM709 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28525] RALBP1 Associated Eps Domain Containing 2 (REPS2, Accession NM\_004726) is a VGAM709 host target gene. REPS2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by REPS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of REPS2 BINDING SITE, designated SEQ ID:11097, to the nucleotide sequence of VGAM709 RNA, herein designated VGAM RNA, also designated SEQ ID:3420.

[28526] A function of VGAM709 is therefore inhibition of RALBP1 Associated Eps Domain Containing 2 (REPS2, Accession NM\_004726), a gene which interacts with the active form of RAS with adaptor protein GRB2 and binds calcium. Accordingly, utilities of VGAM709 include diagnosis, prevention and treatment of diseases and clinical conditions associated with REPS2. The function of REPS2 has been established by previous studies. Small G proteins have GDP-bound inactive and GTP-bound active forms; RAL proteins (e.g., RALA; 179550) shift from the inactive to the active state through the actions of RALGDS (OMIM Ref. No. 601619). RALGDS interacts with the active form of RAS (see OMIM Ref. No. HRAS; 190020). Using RALA-binding protein-1 (RALBP1; 605801) as bait in a yeast 2-hybrid screen of a brain cDNA library, Ikeda et al. (1998) isolated cDNAs encoding REPS2, which they termed POB1. Sequence analysis predicted that the 521-amino acid protein has 2 potential initiator methionines in its N termi-

nus, a central EPS15 (OMIM Ref. No. 600051)–like domain, and 2 proline–rich regions and a putative coiled–coil structure in its C terminus. Northern blot analysis revealed strong expression in rat cerebrum, cerebellum, lung, and testis, with weak expression in kidney and no expression in heart, thymus, liver, spleen, or adrenal gland. Immuno–precipitation and immunoblot analyses confirmed that the C–terminal 146 amino acids of REPS2 and the C–terminal 147 residues of RALBP1 interact in intact cells. RAL interacts with a distinct region of RALBP1, just N terminal of the REPS2–binding domain, and both proteins can interact simultaneously with RALBP1. Immunoblot analysis established that REPS2 is tyrosine phosphorylated in response to epidermal growth factor (EGF; 131530) and interacts with the EGF receptor (EGFR; 131550), possibly through the adaptor protein GRB2 (OMIM Ref. No. 108355), with which REPS2 interacts specifically. Using nuclear magnetic resonance spectroscopy, Koshihara et al. (1999) showed that the EPS15 homology domain of REPS2 consists of 2 EF–hand structures, the second of which binds calcium.

[28527] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [28528] Ikeda, M.; Ishida, O.; Hinoi, T.; Kishida, S.; Kikuchi, A. : Identification and characterization of a novel protein interacting with Ral-binding protein 1, a putative effector protein of Ral. *J. Biol. Chem.* 273: 814–821, 1998. ; and
- [28529] Koshiba, S.; Kigawa, T.; Iwahara, J.; Kikuchi, A.; Yokoyama, S. : Solution structure of the Eps15 homology domain of a human POB1 (partner of RalBP1). *FEBS Lett.* 442: 138–142, 1999.
- [28530] Further studies establishing the function and utilities of REPS2 are found in John Hopkins OMIM database record ID 300317, and in cited publications numbered 9445–9446 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Transient Receptor Potential Cation Channel, Subfamily M, Member 8 (TRPM8, Accession NM\_024080) is another VGAM709 host target gene. TRPM8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRPM8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPM8 BINDING SITE, designated SEQ ID:23514, to the nucleotide sequence of VGAM709 RNA, herein designated VGAM RNA, also designated SEQ

ID:3420.

[28531] Another function of VGAM709 is therefore inhibition of Transient Receptor Potential Cation Channel, Subfamily M, Member 8 (TRPM8, Accession NM\_024080), a gene which is thought to form a receptor-activated calcium permeant cation channel. Accordingly, utilities of VGAM709 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPM8. The function of TRPM8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM201.LOC199923 (Accession XM\_114057) is another VGAM709 host target gene. LOC199923 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC199923, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199923 BINDING SITE, designated SEQ ID:42667, to the nucleotide sequence of VGAM709 RNA, herein designated VGAM RNA, also designated SEQ ID:3420.

[28532] Another function of VGAM709 is therefore inhibition of LOC199923 (Accession XM\_114057). Accordingly, utilities

of VGAM709 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199923. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 710 (VGAM710) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28533] VGAM710 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM710 was detected is described hereinabove with reference to Figs. 1–8.

[28534] VGAM710 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pestivirus Type 2. VGAM710 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28535] VGAM710 gene encodes a VGAM710 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM710 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide se–

quence of VGAM710 precursor RNA is designated SEQ ID:696, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:696 is located at position 4562 relative to the genome of Pestivirus Type 2.

[28536] VGAM710 precursor RNA folds onto itself, forming VGAM710 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28537] An enzyme complex designated DICER COMPLEX, `dices` the VGAM710 folded precursor RNA into VGAM710 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM710 RNA is designated SEQ ID:3421, and

is provided hereinbelow with reference to the sequence listing part.

[28538] VGAM710 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM710 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM710 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[28539] VGAM710 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM710 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM710 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM710 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM710 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[28540] The complementary binding of VGAM710 RNA, herein designated VGAM RNA, to host target binding sites on VGAM710 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM710 host target RNA into VGAM710 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28541] It is appreciated that VGAM710 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM710 host target genes. The mRNA of each one of this plurality of VGAM710 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM710 RNA, herein designated VGAM RNA, and which when bound by VGAM710 RNA causes inhibition of translation of respective one or more VGAM710 host target proteins.

[28542] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM710 gene, herein designated VGAM GENE, on one or more VGAM710 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[28543] It is yet further appreciated that a function of VGAM710 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM710 include diagnosis, prevention and treatment of viral infection by Pestivirus Type 2. Specific functions, and accordingly utilities, of VGAM710 correlate with, and may be deduced from, the identity of the host target genes which VGAM710 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28544] Nucleotide sequences of the VGAM710 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM710 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM710 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM710 are further described hereinbelow with reference to Table 1.

[28545] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM710 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM710 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28546] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM710 gene, herein designated VGAM is inhibition of expression of VGAM710 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM710 correlate with, and may be deduced from, the identity of the target genes which VGAM710 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28547] Periaxin (PRX, Accession NM\_020956) is a VGAM710 host target gene. PRX BINDING SITE1 and PRX BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PRX, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRX BINDING SITE1 and PRX BINDING SITE2, designated SEQ ID:21936 and SEQ ID:21942 respectively, to the nucleotide sequence of VGAM710 RNA, herein designated VGAM RNA, also designated SEQ ID:3421.

[28548] A function of VGAM710 is therefore inhibition of Periaxin (PRX, Accession NM\_020956), a gene which seems to be required for maintenance of peripheral nerve myelin sheath. may have a role in axon–glial interactions, possibly by interacting with the cytoplasmic domains of integral membrane proteins such as myelin–associated glycoprotein in the periaxonal regions of the schwann cell plasma membrane. may have a role in the early phases of myelin deposition. Accordingly, utilities of VGAM710 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRX. The function of PRX and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM476.FLJ14082 (Accession NM\_025024) is another VGAM710 host target gene. FLJ14082 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14082, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14082 BINDING SITE, designated SEQ ID:24612, to the nucleotide sequence of VGAM710 RNA, herein designated VGAM RNA, also designated SEQ

ID:3421.

[28549] Another function of VGAM710 is therefore inhibition of FLJ14082 (Accession NM\_025024). Accordingly, utilities of VGAM710 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14082. KIAA0444 (Accession XM\_030999) is another VGAM710 host target gene. KIAA0444 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0444, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0444 BINDING SITE, designated SEQ ID:31244, to the nucleotide sequence of VGAM710 RNA, herein designated VGAM RNA, also designated SEQ ID:3421.

[28550] Another function of VGAM710 is therefore inhibition of KIAA0444 (Accession XM\_030999). Accordingly, utilities of VGAM710 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0444. KIAA0574 (Accession XM\_045076) is another VGAM710 host target gene. KIAA0574 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0574, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0574 BINDING SITE, designated SEQ ID:34348, to the nucleotide sequence of VGAM710 RNA, herein designated VGAM RNA, also designated SEQ ID:3421.

[28551] Another function of VGAM710 is therefore inhibition of KIAA0574 (Accession XM\_045076). Accordingly, utilities of VGAM710 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0574. KIAA1209 (Accession XM\_027307) is another VGAM710 host target gene. KIAA1209 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1209, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1209 BINDING SITE, designated SEQ ID:30471, to the nucleotide sequence of VGAM710 RNA, herein designated VGAM RNA, also designated SEQ ID:3421.

[28552] Another function of VGAM710 is therefore inhibition of KIAA1209 (Accession XM\_027307). Accordingly, utilities of VGAM710 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA1209. P450RAI-2 (Accession NM\_019885) is another VGAM710 host target gene. P450RAI-2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by P450RAI-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P450RAI-2 BINDING SITE, designated SEQ ID:21271, to the nucleotide sequence of VGAM710 RNA, herein designated VGAM RNA, also designated SEQ ID:3421.

[28553] Another function of VGAM710 is therefore inhibition of P450RAI-2 (Accession NM\_019885). Accordingly, utilities of VGAM710 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P450RAI-2. RAB, Member of RAS Oncogene Family-like 4 (RABL4, Accession NM\_006860) is another VGAM710 host target gene. RABL4 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RABL4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RABL4 BINDING SITE, designated SEQ

ID:13729, to the nucleotide sequence of VGAM710 RNA, herein designated VGAM RNA, also designated SEQ ID:3421.

[28554] Another function of VGAM710 is therefore inhibition of RAB, Member of RAS Oncogene Family-like 4 (RABL4, Accession NM\_006860). Accordingly, utilities of VGAM710 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RABL4. SEC61A1 (Accession NM\_013336) is another VGAM710 host target gene. SEC61A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEC61A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEC61A1 BINDING SITE, designated SEQ ID:14986, to the nucleotide sequence of VGAM710 RNA, herein designated VGAM RNA, also designated SEQ ID:3421.

[28555] Another function of VGAM710 is therefore inhibition of SEC61A1 (Accession NM\_013336). Accordingly, utilities of VGAM710 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEC61A1. T-cell Leukemia/lymphoma 6 (TCL6, Accession

NM\_020553) is another VGAM710 host target gene. TCL6 BINDING SITE1 and TCL6 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TCL6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCL6 BINDING SITE1 and TCL6 BINDING SITE2, designated SEQ ID:21776 and SEQ ID:21778 respectively, to the nucleotide sequence of VGAM710 RNA, herein designated VGAM RNA, also designated SEQ ID:3421.

[28556] Another function of VGAM710 is therefore inhibition of T-cell Leukemia/lymphoma 6 (TCL6, Accession NM\_020553). Accordingly, utilities of VGAM710 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCL6. LOC257596 (Accession XM\_175296) is another VGAM710 host target gene. LOC257596 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257596, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257596 BINDING SITE, desig-

nated SEQ ID:46753, to the nucleotide sequence of VGAM710 RNA, herein designated VGAM RNA, also designated SEQ ID:3421.

[28557] Another function of VGAM710 is therefore inhibition of LOC257596 (Accession XM\_175296). Accordingly, utilities of VGAM710 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257596. LOC63923 (Accession XM\_040527) is another VGAM710 host target gene. LOC63923 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC63923, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC63923 BINDING SITE, designated SEQ ID:33323, to the nucleotide sequence of VGAM710 RNA, herein designated VGAM RNA, also designated SEQ ID:3421.

[28558] Another function of VGAM710 is therefore inhibition of LOC63923 (Accession XM\_040527). Accordingly, utilities of VGAM710 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC63923. LOC92080 (Accession XM\_042704) is another VGAM710 host target gene. LOC92080 BINDING SITE is

HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92080, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92080 BINDING SITE, designated SEQ ID:33760, to the nucleotide sequence of VGAM710 RNA, herein designated VGAM RNA, also designated SEQ ID:3421.

[28559] Another function of VGAM710 is therefore inhibition of LOC92080 (Accession XM\_042704). Accordingly, utilities of VGAM710 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92080. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 711 (VGAM711) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28560] VGAM711 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM711 was detected is described hereinabove with reference to Figs. 1-8.

[28561] VGAM711 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pestivirus Type 2.

VGAM711 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28562] VGAM711 gene encodes a VGAM711 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM711 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM711 precursor RNA is designated SEQ ID:697, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:697 is located at position 2306 relative to the genome of Pestivirus Type 2.

[28563] VGAM711 precursor RNA folds onto itself, forming VGAM711 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nu-

cleotide sequence of the second half thereof.

[28564] An enzyme complex designated DICER COMPLEX, `dices` the VGAM711 folded precursor RNA into VGAM711 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of VGAM711 RNA is designated SEQ ID:3422, and is provided hereinbelow with reference to the sequence listing part.

[28565] VGAM711 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM711 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM711 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[28566] VGAM711 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM711 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM711 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM711 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM711 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[28567] The complementary binding of VGAM711 RNA, herein designated VGAM RNA, to host target binding sites on VGAM711 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM711 host target RNA into VGAM711 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28568] It is appreciated that VGAM711 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM711 host target genes. The mRNA of each one of this plurality of VGAM711 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM711 RNA, herein designated VGAM RNA, and which when bound by VGAM711 RNA causes inhibition of translation of respective one or more VGAM711 host target proteins.

[28569] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM711 gene, herein designated VGAM GENE, on one or more VGAM711 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[28570] It is yet further appreciated that a function of VGAM711 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM711 include diagnosis, prevention and treatment of viral infection by Pestivirus Type 2. Specific functions, and accordingly utilities, of VGAM711 correlate with, and may be deduced from, the identity of the host target genes which VGAM711 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28571] Nucleotide sequences of the VGAM711 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM711 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM711 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM711 are further described hereinbelow with reference to Table 1.

[28572] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM711 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM711 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28573] As mentioned hereinabove with reference to Fig. 1, a function of VGAM711 gene, herein designated VGAM is inhibition of expression of VGAM711 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM711 correlate with, and may be deduced from, the identity of the target genes which VGAM711 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28574] ATPase, Ca++ Transporting, Plasma Membrane 2 (ATP2B2, Accession NM\_001683) is a VGAM711 host target gene. ATP2B2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ATP2B2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of ATP2B2 BINDING SITE, designated SEQ ID:7404, to the nucleotide sequence of VGAM711 RNA, herein designated VGAM RNA, also designated SEQ ID:3422.

[28575] A function of VGAM711 is therefore inhibition of ATPase, Ca++ Transporting, Plasma Membrane 2 (ATP2B2, Accession NM\_001683), a gene which catalyzes the hydrolysis of ATP coupled with the transport of the calcium out of the cell . Accordingly, utilities of VGAM711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP2B2. The function of ATP2B2 has been established by previous studies. Street et al. (1998) demonstrated that the deafwaddler (dfw) mouse mutant, which is deaf and displays vestibular/motor imbalance, has a mutation in the Atp2b2 gene. A A-to-G nucleotide transition in dfw DNA caused a glycine-to-serine substitution at a highly conserved amino acid position, whereas a second mutant allele carried a 2-bp deletion that caused a frameshift predicted to result in a truncated protein. In the cochlea, the Atp2b2 protein is localized to stereocilia and the basolateral wall of hair cells in wildtype mice, but is not detected in deafwaddler

mice. This indicates that mutation of Atp2b2 may cause deafness and imbalance by affecting sensory transduction in stereocilia as well as neurotransmitter release from the basolateral membrane. These mutations affecting Atp2b2 were the first to be found in a mammalian plasma membrane calcium pump and defined a new class of deafness genes that directly affect hair-cell physiology. PMCA2 exhibits a highly restricted tissue distribution, suggesting that it serves more specialized physiologic functions than some of the other PMCA isoforms. A unique role in hearing is suggested by the high levels of PMCA2 expression in cochlear outer hair cells and spiral ganglion cells. Animal model experiments lend further support to the function of ATP2B2. To analyze the physiologic role of PMCA2, Kozel et al. (1998) produced PMCA2-deficient mice by gene targeting. Homozygous PMCA2-null mice grew more slowly than heterozygous and wildtype mice and exhibited an unsteady gait and difficulties in maintaining balance. Histologic analysis of the cerebellum and inner ear of mutant and wildtype mice showed that null mutants have slightly increased numbers of Purkinje neurons (in which PMCA2 is highly expressed), a decreased thickness of the molecular layer, an absence of otoconia in the vestibular

system, and a range of abnormalities of the organ of Corti. Analysis of auditory-evoked brain stem responses showed that homozygous mutants were deaf and that heterozygous mice had a significant hearing loss. These data demonstrated that PMCA2 is required for both balance and hearing and suggested that it may be a major source of the calcium used in the formation and maintenance of otoconia.

[28576] It is appreciated that the abovementioned animal model for ATP2B2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[28577] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[28578] Street, V. A.; McKee-Johnson, J. W.; Fonseca, R. C.; Tempel, B. L.; Noben-Trauth, K. : Mutations in a plasma membrane  $\text{Ca}(2+)$ -ATPase gene cause deafness in deafwaddler mice. *Nature Genet.* 19: 390-394, 1998. ; and

[28579] Kozel, P. J.; Friedman, R. A.; Erway, L. C.; Yamoah, E. N.; Liu, L. H.; Riddle, T.; Duffy, J. J.; Doetschman, T.; Miller, M. L.; Cardell, E. L.; Shull, G. E. : Balance and hearing defic.

[28580] Further studies establishing the function and utilities of

ATP2B2 are found in John Hopkins OMIM database record ID 108733, and in cited publications numbered 3692–3696 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Down-regulator of Transcription 1, TBP-binding (negative cofactor 2) (DR1, Accession XM\_002015) is another VGAM711 host target gene. DR1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DR1 BINDING SITE, designated SEQ ID:29856, to the nucleotide sequence of VGAM711 RNA, herein designated VGAM RNA, also designated SEQ ID:3422.

[28581] Another function of VGAM711 is therefore inhibition of Down-regulator of Transcription 1, TBP-binding (negative cofactor 2) (DR1, Accession XM\_002015), a gene which influences functional repression of both activated and basal transcription of class ii genes. Accordingly, utilities of VGAM711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DR1. The function of DR1 has been established by previous

studies. Several phosphoproteins are known to interact with TBP, the TATA box-binding protein (OMIM Ref. No. 600075). Among them, DR1 is a TBP-associated phosphoprotein that represses both basal and activated levels of transcription. Inostroza et al. (1992) biochemically characterized DR1 purified from HeLa cells and cloned the human gene from a HeLa cell cDNA library. The gene encodes a 176-amino acid polypeptide of 19 kD. They showed that DR1 is phosphorylated in vivo and that phosphorylation of DR1 affected its interaction with TBP. The DR1 protein contains 3 domains: a histone fold motif at the N terminus, a TBP-binding domain, and a glutamine- and alanine-rich region. Mermelstein et al. (1996) showed that the histone fold motif of DR1 is required for DR1-DRAP1 interaction. Both the TBP-binding domain and the glutamine- and alanine-rich region are required for DR1-mediated repression of transcription. Yeung et al. (1997) demonstrated that the TBP-binding domain has 2 functions: it tethers the DR1 repressor complex to the promoter by interacting with TBP, and it is required for the corepression activity of DRAP1, although it is not required for DR1-DRAP1 interaction. Yeung et al. (1997) determined that the glutamine- and alanine-rich region is the

repressor domain of DR1 and that this domain interacts with TBP. Goppelt et al. (1996) proposed that binding of DR1 repressor complexes to TBP-promoter complexes establishes a mechanism in which an altered DNA conformation, together with the formation of higher order complexes, inhibits the assembly of the preinitiation complex and controls the rate of RNA polymerase II transcription.

[28582] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[28583] Inostroza, J. A.; Mermeistein, F. H.; Ha, I.; Lane, W. S.; Reinberg, D. : Dr1, a TATA-binding protein-associated phosphoprotein and inhibitor of class II gene transcription. Cell 70: 477-489, 1992. ; and

[28584] Mermelstein, F.; Yeung, K.; Cao, J.; Inostroza, J. A.; Erdjument-Bromage, H.; Egelson, K.; Landsman, D.; Levitt, P.; Tempst, P.; Reinberg, D. : Requirement of a corepressor for Dr1-med.

[28585] Further studies establishing the function and utilities of DR1 are found in John Hopkins OMIM database record ID 601482, and in cited publications numbered 6516-651 and 9241-6523 listed in the bibliography section hereinbelow, which are also hereby incorporated by refer-

ence. E2F Transcription Factor 1 (E2F1, Accession XM\_097772) is another VGAM711 host target gene. E2F1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by E2F1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of E2F1 BINDING SITE, designated SEQ ID:41119, to the nucleotide sequence of VGAM711 RNA, herein designated VGAM RNA, also designated SEQ ID:3422.

[28586] Another function of VGAM711 is therefore inhibition of E2F Transcription Factor 1 (E2F1, Accession XM\_097772), a gene which involved in cell cycle regulation, mediates G1 arrest when bound to Rb. Accordingly, utilities of VGAM711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with E2F1. The function of E2F1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM430. Fatty Acid Amide Hydrolase (FAAH, Accession NM\_024306) is another VGAM711 host target gene. FAAH BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FAAH, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FAAH BINDING SITE, designated SEQ ID:23596, to the nucleotide sequence of VGAM711 RNA, herein designated VGAM RNA, also designated SEQ ID:3422.

[28587] Another function of VGAM711 is therefore inhibition of Fatty Acid Amide Hydrolase (FAAH, Accession NM\_024306), a gene which function as an electron carrier for several membrane bound oxygenases (by similarity). Accordingly, utilities of VGAM711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FAAH. The function of FAAH has been established by previous studies. To evaluate FAAH genes as candidates for neurogenetic diseases in humans and mice, Wan et al. (1998) mapped the loci in both species and determined their intron-exon structures using PCR analysis of somatic cell hybrids and radiation hybrid mapping panels. Analysis of a somatic cell hybrid mapping panel and a mouse interspecific backcross panel localized the Faah gene to the conserved syntenic region on mouse chromosome 4, close to the neurologic mutation 'clasper.' No sequence abnormality or rearrangement of the Faah gene

was found to explain the clasper phenotype. Furthermore, FAAH protein levels were normal in clasper mouse tissues. Problem drug use and dependence are neurobehavioral disorders of complex origin. Although environmental factors contribute to drug abuse and addiction, genetic factors play a significant role estimated at 40 to 60% of the total risk. In the course of a search for the human genes that confer vulnerability to problem drug use, Sipe et al. (2002) identified a single-nucleotide polymorphism (SNP) in the FAAH gene, that in homozygous form is strongly associated with both street drug use and problem drug/alcohol use. This SNP (OMIM Ref. No. 385C-A) results in a missense mutation that converts a conserved proline residue to threonine (pro129 OMIM Ref. No. 602935.0001), producing an FAAH variant that displays normal catalytic properties but at enhanced sensitivity to proteolytic degradation. Collectively, these results suggested that genetic mutations in FAAH may constitute important risk factors for problem drug use and support a potential link between functional abnormalities in the endogenous cannabinoid system and drug abuse and dependence.

[28588] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [28589] Sipe, J. C.; Chiang, K.; Gerber, A. L.; Beutler, E.; Cravatt, B. F. : A missense mutation in human fatty acid amide hydrolase associated with problem drug use. Proc. Nat. Acad. Sci. 99: 8394–8399, 2002. ; and
- [28590] Wan, M.; Cravatt, B. F.; Ring, H. Z.; Zhang, X.; Francke, U. : Conserved chromosomal location and genomic structure of human and mouse fatty-acid amide hydrolase genes and evaluation of.
- [28591] Further studies establishing the function and utilities of FAAH are found in John Hopkins OMIM database record ID 602935, and in cited publications numbered 7974–7977 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Sorbin and SH3 Domain Containing 1 (SORBS1, Accession NM\_015385) is another VGAM711 host target gene. SORBS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SORBS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SORBS1 BINDING SITE, designated SEQ ID:17686, to the nucleotide

sequence of VGAM711 RNA, herein designated VGAM RNA, also designated SEQ ID:3422.

[28592] Another function of VGAM711 is therefore inhibition of Sorbin and SH3 Domain Containing 1 (SORBS1, Accession NM\_015385), a gene which necessary for cell polarization during vegetative growth. Accordingly, utilities of VGAM711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SORBS1. The function of SORBS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM475. TYRO3 Protein Tyrosine Kinase (TYRO3, Accession NM\_006293) is another VGAM711 host target gene. TYRO3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TYRO3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TYRO3 BINDING SITE, designated SEQ ID:12985, to the nucleotide sequence of VGAM711 RNA, herein designated VGAM RNA, also designated SEQ ID:3422.

[28593] Another function of VGAM711 is therefore inhibition of

TYRO3 Protein Tyrosine Kinase (TYRO3, Accession NM\_006293), a gene which may be involved in cell adhesion processes, particularly in the central nervous system. Accordingly, utilities of VGAM711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TYRO3. The function of TYRO3 has been established by previous studies. Polvi et al. (1993) cloned partial cDNAs of the human TYRO3 gene encoding a putative receptor tyrosine kinase and its processed pseudogene (OMIM Ref. No. TYRO3P) from human teratocarcinoma cell, bone marrow, and melanocyte cDNA libraries. The tyrosine kinase homologous domains of the 2 genes were sequenced and compared with each other and with the mouse Tyro3 gene. Abundant levels of the 4.2-kb TYRO3 mRNA were detected in human brain and lower levels in other human tissues. Animal model experiments lend further support to the function of TYRO3. Regulation of lymphocyte numbers is mediated by cytokines signaling through receptors coupled to cytoplasmic protein-tyrosine kinases. Lu and Lemke (2001) generated mice deficient in Mertk (OMIM Ref. No. 604705), Axl (OMIM Ref. No. 109135), and Tyro3. Like their ligands, GAS6 (OMIM Ref. No. 600441) and PROS1 (OMIM Ref. No. 176880),

these receptors are widely expressed in monocytes and macrophages but not in B or T lymphocytes. Although the peripheral lymphoid organs of mutant mice were indistinguishable from those of wildtype mice at birth, by 4 weeks of age spleens and lymph nodes grew at elevated rates. This was primarily due to the hyperproliferation of constitutively activated B and T cells, particularly CD4-positive T cells, with ectopic colonies in every adult organ examined. All triple mutants developed autoimmunity with symptoms histologically similar to human rheumatoid arthritis (OMIM Ref. No. 180300), pemphigus vulgaris (OMIM Ref. No. 169610), and systemic lupus erythematosus (OMIM Ref. No. 152700), and were characterized by antibodies against normal cellular antigens, including phospholipids and double-stranded DNA. Females were particularly prone to thromboses and recurrent fetal loss. Flow cytometric analysis demonstrated that wildtype B and T cells underwent multiple rounds of cell division after injection into mutant mice and that their antigen-presenting cells expressed elevated levels of activation markers. Lu and Lemke (2001) proposed that the cells that initiate lymphoproliferation and autoimmunity in the Tyro3 family mutants were the macrophages and dendritic cells that

normally express the 3 receptor genes.

[28594] It is appreciated that the abovementioned animal model for TYRO3 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[28595] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[28596] Polvi, A.; Armstrong, E.; Lai, C.; Lemke, G.; Huebner, K.; Spritz, R. A.; Guida, L. C.; Nicholls, R. D.; Alitalo, K. : The human TYRO3 gene and pseudogene are located in chromosome 15q14–q25. *Gene* 134: 289–293, 1993. ; and

[28597] Lu, Q.; Lemke, G. : Homeostatic regulation of the immune system by receptor tyrosine kinases of the Tyro 3 family. *Science* 293: 306–311, 2001.

[28598] Further studies establishing the function and utilities of TYRO3 are found in John Hopkins OMIM database record ID 600341, and in cited publications numbered 507 and 12302 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Ubiquitin–conjugating Enzyme E2L 3 (UBE2L3, Accession NM\_003347) is another VGAM711 host target gene. UBE2L3 BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by UBE2L3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBE2L3 BINDING SITE, designated SEQ ID:9357, to the nucleotide sequence of VGAM711 RNA, herein designated VGAM RNA, also designated SEQ ID:3422.

[28599] Another function of VGAM711 is therefore inhibition of Ubiquitin-conjugating Enzyme E2L 3 (UBE2L3, Accession NM\_003347), a gene which catalyzes the covalent attachment of ubiquitin to other proteins. Accordingly, utilities of VGAM711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE2L3. The function of UBE2L3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM215. Chromosome 1 Open Reading Frame 34 (C1orf34, Accession XM\_027172) is another VGAM711 host target gene. C1orf34 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C1orf34, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1orf34 BINDING SITE, designated SEQ ID:30438, to the nucleotide sequence of VGAM711 RNA, herein designated VGAM RNA, also designated SEQ ID:3422.

[28600] Another function of VGAM711 is therefore inhibition of Chromosome 1 Open Reading Frame 34 (C1orf34, Accession XM\_027172). Accordingly, utilities of VGAM711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf34. FLJ13305 (Accession XM\_117270) is another VGAM711 host target gene. FLJ13305 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ13305, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13305 BINDING SITE, designated SEQ ID:43344, to the nucleotide sequence of VGAM711 RNA, herein designated VGAM RNA, also designated SEQ ID:3422.

[28601] Another function of VGAM711 is therefore inhibition of FLJ13305 (Accession XM\_117270). Accordingly, utilities of VGAM711 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FLJ13305. KIAA1634 (Accession XM\_032749) is another VGAM711 host target gene. KIAA1634 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1634, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1634 BINDING SITE, designated SEQ ID:31753, to the nucleotide sequence of VGAM711 RNA, herein designated VGAM RNA, also designated SEQ ID:3422.

[28602] Another function of VGAM711 is therefore inhibition of KIAA1634 (Accession XM\_032749). Accordingly, utilities of VGAM711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1634. MGC11287 (Accession NM\_031464) is another VGAM711 host target gene. MGC11287 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC11287, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC11287 BINDING SITE, designated SEQ ID:25502, to

the nucleotide sequence of VGAM711 RNA, herein designated VGAM RNA, also designated SEQ ID:3422.

[28603] Another function of VGAM711 is therefore inhibition of MGC11287 (Accession NM\_031464). Accordingly, utilities of VGAM711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC11287. P114-RHO-GEF (Accession NM\_015318) is another VGAM711 host target gene. P114-RHO-GEF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by P114-RHO-GEF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P114-RHO-GEF BINDING SITE, designated SEQ ID:17638, to the nucleotide sequence of VGAM711 RNA, herein designated VGAM RNA, also designated SEQ ID:3422.

[28604] Another function of VGAM711 is therefore inhibition of P114-RHO-GEF (Accession NM\_015318). Accordingly, utilities of VGAM711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P114-RHO-GEF. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 16B (PPP1R16B, Accession XM\_028840)

is another VGAM711 host target gene. PPP1R16B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP1R16B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R16B BINDING SITE, designated SEQ ID:30770, to the nucleotide sequence of VGAM711 RNA, herein designated VGAM RNA, also designated SEQ ID:3422.

[28605] Another function of VGAM711 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 16B (PPP1R16B, Accession XM\_028840). Accordingly, utilities of VGAM711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R16B. Retinoic Acid Induced 16 (RAI16, Accession NM\_022749) is another VGAM711 host target gene. RAI16 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAI16, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAI16 BINDING SITE, designated SEQ ID:22969, to the nucleotide sequence of VGAM711 RNA, herein designated

VGAM RNA, also designated SEQ ID:3422.

[28606] Another function of VGAM711 is therefore inhibition of Retinoic Acid Induced 16 (RAI16, Accession NM\_022749). Accordingly, utilities of VGAM711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAI16. T-cell Lymphoma Invasion and Metastasis 2 (TIAM2, Accession NM\_012454) is another VGAM711 host target gene. TIAM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TIAM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIAM2 BINDING SITE, designated SEQ ID:14824, to the nucleotide sequence of VGAM711 RNA, herein designated VGAM RNA, also designated SEQ ID:3422.

[28607] Another function of VGAM711 is therefore inhibition of T-cell Lymphoma Invasion and Metastasis 2 (TIAM2, Accession NM\_012454). Accordingly, utilities of VGAM711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIAM2. Translocase of Inner Mitochondrial Membrane 9 Homolog (yeast) (TIMM9, Accession NM\_012460) is another VGAM711 host target

gene. TIMM9 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TIMM9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIMM9 BINDING SITE, designated SEQ ID:14832, to the nucleotide sequence of VGAM711 RNA, herein designated VGAM RNA, also designated SEQ ID:3422.

[28608] Another function of VGAM711 is therefore inhibition of Translocase of Inner Mitochondrial Membrane 9 Homolog (yeast) (TIMM9, Accession NM\_012460). Accordingly, utilities of VGAM711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIMM9. LOC112868 (Accession XM\_053402) is another VGAM711 host target gene. LOC112868 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC112868, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC112868 BINDING SITE, designated SEQ ID:36077, to the nucleotide sequence of VGAM711 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3422.

[28609] Another function of VGAM711 is therefore inhibition of LOC112868 (Accession XM\_053402). Accordingly, utilities of VGAM711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC112868. LOC116228 (Accession XM\_057659) is another VGAM711 host target gene. LOC116228 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC116228, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC116228 BINDING SITE, designated SEQ ID:36534, to the nucleotide sequence of VGAM711 RNA, herein designated VGAM RNA, also designated SEQ ID:3422.

[28610] Another function of VGAM711 is therefore inhibition of LOC116228 (Accession XM\_057659). Accordingly, utilities of VGAM711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC116228. LOC201910 (Accession XM\_114403) is another VGAM711 host target gene. LOC201910 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201910, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201910 BINDING SITE, designated SEQ ID:42929, to the nucleotide sequence of VGAM711 RNA, herein designated VGAM RNA, also designated SEQ ID:3422.

[28611] Another function of VGAM711 is therefore inhibition of LOC201910 (Accession XM\_114403). Accordingly, utilities of VGAM711 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201910. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 712 (VGAM712) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28612] VGAM712 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM712 was detected is described hereinabove with reference to Figs. 1–8.

[28613] VGAM712 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pestivirus Type 2.

VGAM712 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28614] VGAM712 gene encodes a VGAM712 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM712 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM712 precursor RNA is designated SEQ ID:698, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:698 is located at position 2668 relative to the genome of Pestivirus Type 2.

[28615] VGAM712 precursor RNA folds onto itself, forming VGAM712 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28616] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM712 folded precursor RNA into VGAM712 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM712 RNA is designated SEQ ID:3423, and is provided hereinbelow with reference to the sequence listing part.

[28617] VGAM712 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM712 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM712 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[28618] VGAM712 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM712 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM712 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM712 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM712 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[28619] The complementary binding of VGAM712 RNA, herein designated VGAM RNA, to host target binding sites on VGAM712 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM712 host target RNA into VGAM712 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28620] It is appreciated that VGAM712 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM712 host target genes. The mRNA of each one of this plurality of VGAM712 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM712 RNA, herein designated VGAM RNA, and which when bound by VGAM712 RNA causes inhibition of translation of respective one or more VGAM712 host target proteins.

[28621] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM712 gene, herein designated VGAM GENE, on one or more VGAM712 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[28622] It is yet further appreciated that a function of VGAM712 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM712 include diagnosis, prevention and treatment of viral infection by Pestivirus Type 2. Specific functions, and accordingly utilities, of VGAM712 correlate with, and may be deduced from, the identity of the host target genes which VGAM712 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28623] Nucleotide sequences of the VGAM712 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM712 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM712 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM712 are further described hereinbelow with reference to Table 1.

[28624] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM712 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM712 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28625] As mentioned hereinabove with reference to Fig. 1, a function of VGAM712 gene, herein designated VGAM is inhibition of expression of VGAM712 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM712 correlate with, and may be deduced from, the identity of the target genes which VGAM712 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28626] DKFZp566D234 (Accession XM\_030162) is a VGAM712 host target gene. DKFZp566D234 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZp566D234, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp566D234 BINDING SITE, designated SEQ ID:30991, to

the nucleotide sequence of VGAM712 RNA, herein designated VGAM RNA, also designated SEQ ID:3423.

[28627] A function of VGAM712 is therefore inhibition of DKFZp566D234 (Accession XM\_030162). Accordingly, utilities of VGAM712 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp566D234. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 713 (VGAM713) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28628] VGAM713 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM713 was detected is described hereinabove with reference to Figs. 1–8.

[28629] VGAM713 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Herpesvirus 4. VGAM713 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28630] VGAM713 gene encodes a VGAM713 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM713 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM713 precursor RNA is designated SEQ ID:699, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:699 is located at position 103800 relative to the genome of Bovine Herpesvirus 4.

[28631] VGAM713 precursor RNA folds onto itself, forming VGAM713 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28632] An enzyme complex designated DICER COMPLEX, `dices` the VGAM713 folded precursor RNA into VGAM713 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM713 RNA is designated SEQ ID:3424, and is provided hereinbelow with reference to the sequence listing part.

[28633] VGAM713 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM713 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM713 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[28634] VGAM713 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM713 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM713 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM713 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM713 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[28635] The complementary binding of VGAM713 RNA, herein designated VGAM RNA, to host target binding sites on VGAM713 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM713 host target RNA into VGAM713 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28636] It is appreciated that VGAM713 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM713 host target genes. The mRNA of each one of this plurality of VGAM713 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM713 RNA, herein designated VGAM RNA, and which when bound by VGAM713 RNA causes inhibition of translation of respective one or more VGAM713 host target proteins.

[28637] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM713 gene, herein designated VGAM GENE, on one or more VGAM713 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[28638] It is yet further appreciated that a function of VGAM713 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM713 include diagnosis, prevention and treatment of viral infection by Bovine Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM713 correlate with, and may be deduced from, the identity of the host target genes which VGAM713 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28639] Nucleotide sequences of the VGAM713 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM713 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM713 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM713 are further described hereinbelow with reference to Table 1.

[28640] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM713 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM713 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28641] As mentioned hereinabove with reference to Fig. 1, a function of VGAM713 gene, herein designated VGAM is inhibition of expression of VGAM713 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM713 correlate with, and may be deduced from, the identity of the target genes which VGAM713 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28642] Core-binding Factor, Runt Domain, Alpha Subunit 2; Translocated To, 1; Cyclin D-related (CBFA2T1, Accession NM\_004349) is a VGAM713 host target gene. CBFA2T1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CBFA2T1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CBFA2T1 BINDING SITE, designated SEQ ID:10544, to the nucleotide sequence of VGAM713 RNA, herein designated VGAM RNA, also designated SEQ ID:3424.

[28643] A function of VGAM713 is therefore inhibition of Core-binding Factor, Runt Domain, Alpha Subunit 2; Translocated To, 1; Cyclin D-related (CBFA2T1, Accession NM\_004349), a gene which produces a chimeric gene made up of the 5-prime region of the AML1 gene fused to the 3-prime region of the ETO gene through translocation. Accordingly, utilities of VGAM713 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBFA2T1. The function of CBFA2T1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM113.

Diacylglycerol O-acyltransferase Homolog 2 (mouse) (DGAT2, Accession NM\_032564) is another VGAM713 host target gene. DGAT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DGAT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DGAT2 BINDING SITE, designated SEQ ID:26293, to the nucleotide sequence of VGAM713 RNA, herein designated VGAM RNA, also designated SEQ ID:3424.

[28644] Another function of VGAM713 is therefore inhibition of Diacylglycerol O-acyltransferase Homolog 2 (mouse) (DGAT2, Accession NM\_032564). Accordingly, utilities of VGAM713 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DGAT2. Interleukin 24 (IL24, Accession NM\_006850) is another VGAM713 host target gene. IL24 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL24, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL24 BINDING SITE, designated SEQ ID:13721, to the nucleotide sequence of VGAM713 RNA, herein designated VGAM RNA, also designated SEQ ID:3424.

[28645] Another function of VGAM713 is therefore inhibition of Interleukin 24 (IL24, Accession NM\_006850), a gene which may contribute to terminal cell differentiation. Accordingly, utilities of VGAM713 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL24. The function of IL24 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove

with reference to VGAM258. Microtubule-associated Protein, RP/EB Family, Member 1 (MAPRE1, Accession NM\_012325) is another VGAM713 host target gene. MAPRE1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAPRE1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPRE1 BINDING SITE, designated SEQ ID:14707, to the nucleotide sequence of VGAM713 RNA, herein designated VGAM RNA, also designated SEQ ID:3424.

[28646] Another function of VGAM713 is therefore inhibition of Microtubule-associated Protein, RP/EB Family, Member 1 (MAPRE1, Accession NM\_012325). Accordingly, utilities of VGAM713 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPRE1. Neogenin Homolog 1 (chicken) (NEO1, Accession NM\_002499) is another VGAM713 host target gene. NEO1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NEO1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of NEO1 BINDING SITE, designated SEQ ID:8316, to the nucleotide sequence of VGAM713 RNA, herein designated VGAM RNA, also designated SEQ ID:3424.

[28647] Another function of VGAM713 is therefore inhibition of Neogenin Homolog 1 (chicken) (NEO1, Accession NM\_002499), a gene which regulates the transition of undifferentiated proliferating cells to their differentiated state. Accordingly, utilities of VGAM713 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEO1. The function of NEO1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM329. Phosphotriesterase Related (PTER, Accession NM\_030664) is another VGAM713 host target gene. PTER BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTER, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTER BINDING SITE, designated SEQ ID:25000, to the nucleotide sequence of VGAM713 RNA, herein designated

VGAM RNA, also designated SEQ ID:3424.

[28648] Another function of VGAM713 is therefore inhibition of Phosphotriesterase Related (PTER, Accession NM\_030664), a gene which is a phosphotriesterase homology protein. Accordingly, utilities of VGAM713 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTER. The function of PTER has been established by previous studies. Microbial phosphotriesterases are a group of zinc metalloenzymes that catalyze the hydrolysis of a range of phosphotriester compounds. Davies et al. (1997) isolated rat cDNAs encoding a phosphotriesterase homolog, which they named rpr1. Using a rat rpr1 cDNA as a hybridization probe, Alimova-Kost et al. (1998) isolated human genomic sequences of PTER, a homolog of phosphotriesterases. By FISH, Alimova-Kost et al. (1998) mapped the human PTER gene to 10p12

[28649] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[28650] Alimova-Kost, M. V.; Imreh, S.; Buchman, V. L.; Ninkina, N. N. : Assignment of phosphotriesterase-related gene (PTER) to human chromosome band 10p12 by in situ hy-

bridization. Cytogenet. Cell Genet. 83: 16–17, 1998. ; and

[28651] Davies, J. A.; Buchman, V. L.; Krylova, O.; Ninkina, N. N. :  
Molecular cloning and expression pattern of rpr-1, a  
resiniferatoxin-binding, phosphotriesterase-related pro-  
tein, expressed.

[28652] Further studies establishing the function and utilities of  
PTER are found in John Hopkins OMIM database record ID  
604446, and in cited publications numbered 1096–1097  
listed in the bibliography section hereinbelow, which are  
also hereby incorporated by reference. Recombination Ac-  
tivating Gene 1 (RAG1, Accession NM\_000448) is another  
VGAM713 host target gene. RAG1 BINDING SITE is HOST  
TARGET binding site found in the 3` untranslated region  
of mRNA encoded by RAG1, corresponding to a HOST  
TARGET binding site such as BINDING SITE I, BINDING SITE  
II or BINDING SITE III. Table 2 illustrates the complemen-  
tarity of the nucleotide sequences of RAG1 BINDING SITE,  
designated SEQ ID:6041, to the nucleotide sequence of  
VGAM713 RNA, herein designated VGAM RNA, also desig-  
nated SEQ ID:3424.

[28653] Another function of VGAM713 is therefore inhibition of  
Recombination Activating Gene 1 (RAG1, Accession  
NM\_000448). Accordingly, utilities of VGAM713 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with RAG1. Sirtuin Silent Mating Type Information Regulation 2 Homolog 3 (*S. cerevisiae*) (SIRT3, Accession NM\_012239) is another VGAM713 host target gene. SIRT3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SIRT3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIRT3 BINDING SITE, designated SEQ ID:14546, to the nucleotide sequence of VGAM713 RNA, herein designated VGAM RNA, also designated SEQ ID:3424.

[28654] Another function of VGAM713 is therefore inhibition of Sirtuin Silent Mating Type Information Regulation 2 Homolog 3 (*S. cerevisiae*) (SIRT3, Accession NM\_012239), a gene which might function in telomeric silencing, cell cycle progression and chromosome stability. Accordingly, utilities of VGAM713 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIRT3. The function of SIRT3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with

reference to VGAM140. Spondin 1, (f-spondin) Extracellular Matrix Protein (SPON1, Accession XM\_031184) is another VGAM713 host target gene. SPON1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SPON1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPON1 BINDING SITE, designated SEQ ID:31305, to the nucleotide sequence of VGAM713 RNA, herein designated VGAM RNA, also designated SEQ ID:3424.

[28655] Another function of VGAM713 is therefore inhibition of Spondin 1, (f-spondin) Extracellular Matrix Protein (SPON1, Accession XM\_031184). Accordingly, utilities of VGAM713 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPON1. Zinc Finger Protein 74 (Cos52) (ZNF74, Accession NM\_003426) is another VGAM713 host target gene. ZNF74 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF74, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of ZNF74 BINDING SITE, designated SEQ ID:9473, to the nucleotide sequence of VGAM713 RNA, herein designated VGAM RNA, also designated SEQ ID:3424.

[28656] Another function of VGAM713 is therefore inhibition of Zinc Finger Protein 74 (Cos52) (ZNF74, Accession NM\_003426). Accordingly, utilities of VGAM713 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF74. Chromosome 21 Open Reading Frame 69 (C21orf69, Accession NM\_058189) is another VGAM713 host target gene. C21orf69 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by C21orf69, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C21orf69 BINDING SITE, designated SEQ ID:27752, to the nucleotide sequence of VGAM713 RNA, herein designated VGAM RNA, also designated SEQ ID:3424.

[28657] Another function of VGAM713 is therefore inhibition of Chromosome 21 Open Reading Frame 69 (C21orf69, Accession NM\_058189). Accordingly, utilities of VGAM713 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with C21orf69. Choline Kinase (CHK, Accession NM\_001277) is another VGAM713 host target gene. CHK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CHK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHK BINDING SITE, designated SEQ ID:6946, to the nucleotide sequence of VGAM713 RNA, herein designated VGAM RNA, also designated SEQ ID:3424.

[28658] Another function of VGAM713 is therefore inhibition of Choline Kinase (CHK, Accession NM\_001277). Accordingly, utilities of VGAM713 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHK. DKFZP434N1235 (Accession NM\_031291) is another VGAM713 host target gene. DKFZP434N1235 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434N1235, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434N1235 BINDING SITE,

designated SEQ ID:25313, to the nucleotide sequence of VGAM713 RNA, herein designated VGAM RNA, also designated SEQ ID:3424.

[28659] Another function of VGAM713 is therefore inhibition of DKFZP434N1235 (Accession NM\_031291). Accordingly, utilities of VGAM713 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434N1235. DKFZp547H025 (Accession NM\_020161) is another VGAM713 host target gene. DKFZp547H025 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp547H025, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547H025 BINDING SITE, designated SEQ ID:21376, to the nucleotide sequence of VGAM713 RNA, herein designated VGAM RNA, also designated SEQ ID:3424.

[28660] Another function of VGAM713 is therefore inhibition of DKFZp547H025 (Accession NM\_020161). Accordingly, utilities of VGAM713 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547H025. DRIL2 (Accession NM\_006465) is

another VGAM713 host target gene. DRIL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DRIL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DRIL2 BINDING SITE, designated SEQ ID:13192, to the nucleotide sequence of VGAM713 RNA, herein designated VGAM RNA, also designated SEQ ID:3424.

[28661] Another function of VGAM713 is therefore inhibition of DRIL2 (Accession NM\_006465). Accordingly, utilities of VGAM713 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DRIL2. FLJ12294 (Accession NM\_025100) is another VGAM713 host target gene. FLJ12294 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12294, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12294 BINDING SITE, designated SEQ ID:24745, to the nucleotide sequence of VGAM713 RNA, herein designated VGAM RNA, also designated SEQ ID:3424.

[28662] Another function of VGAM713 is therefore inhibition of FLJ12294 (Accession NM\_025100). Accordingly, utilities of VGAM713 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12294. FLJ12476 (Accession NM\_022784) is another VGAM713 host target gene. FLJ12476 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ12476, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12476 BINDING SITE, designated SEQ ID:23068, to the nucleotide sequence of VGAM713 RNA, herein designated VGAM RNA, also designated SEQ ID:3424.

[28663] Another function of VGAM713 is therefore inhibition of FLJ12476 (Accession NM\_022784). Accordingly, utilities of VGAM713 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12476. FLJ14525 (Accession NM\_032800) is another VGAM713 host target gene. FLJ14525 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14525, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14525 BINDING SITE, designated SEQ ID:26551, to the nucleotide sequence of VGAM713 RNA, herein designated VGAM RNA, also designated SEQ ID:3424.

[28664] Another function of VGAM713 is therefore inhibition of FLJ14525 (Accession NM\_032800). Accordingly, utilities of VGAM713 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14525. FLJ20511 (Accession NM\_017853) is another VGAM713 host target gene. FLJ20511 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20511, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20511 BINDING SITE, designated SEQ ID:19528, to the nucleotide sequence of VGAM713 RNA, herein designated VGAM RNA, also designated SEQ ID:3424.

[28665] Another function of VGAM713 is therefore inhibition of FLJ20511 (Accession NM\_017853). Accordingly, utilities of VGAM713 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20511.

FLJ23120 (Accession XM\_097961) is another VGAM713 host target gene. FLJ23120 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23120, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23120 BINDING SITE, designated SEQ ID:41264, to the nucleotide sequence of VGAM713 RNA, herein designated VGAM RNA, also designated SEQ ID:3424.

[28666] Another function of VGAM713 is therefore inhibition of FLJ23120 (Accession XM\_097961). Accordingly, utilities of VGAM713 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23120. FLJ31951 (Accession NM\_144726) is another VGAM713 host target gene. FLJ31951 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ31951, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ31951 BINDING SITE, designated SEQ ID:29552, to the nucleotide sequence of VGAM713 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:3424.

[28667] Another function of VGAM713 is therefore inhibition of FLJ31951 (Accession NM\_144726). Accordingly, utilities of VGAM713 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31951. KIAA0317 (Accession NM\_014821) is another VGAM713 host target gene. KIAA0317 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0317, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0317 BINDING SITE, designated SEQ ID:16798, to the nucleotide sequence of VGAM713 RNA, herein designated VGAM RNA, also designated SEQ ID:3424.

[28668] Another function of VGAM713 is therefore inhibition of KIAA0317 (Accession NM\_014821). Accordingly, utilities of VGAM713 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0317. KIAA0321 (Accession XM\_031077) is another VGAM713 host target gene. KIAA0321 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0321, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0321 BINDING SITE, designated SEQ ID:31269, to the nucleotide sequence of VGAM713 RNA, herein designated VGAM RNA, also designated SEQ ID:3424.

[28669] Another function of VGAM713 is therefore inhibition of KIAA0321 (Accession XM\_031077). Accordingly, utilities of VGAM713 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0321. KIAA0523 (Accession XM\_041964) is another VGAM713 host target gene. KIAA0523 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0523, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0523 BINDING SITE, designated SEQ ID:33647, to the nucleotide sequence of VGAM713 RNA, herein designated VGAM RNA, also designated SEQ ID:3424.

[28670] Another function of VGAM713 is therefore inhibition of KIAA0523 (Accession XM\_041964). Accordingly, utilities of VGAM713 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA0523. KIAA1598 (Accession NM\_018330) is another VGAM713 host target gene. KIAA1598 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1598, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1598 BINDING SITE, designated SEQ ID:20330, to the nucleotide sequence of VGAM713 RNA, herein designated VGAM RNA, also designated SEQ ID:3424.

[28671] Another function of VGAM713 is therefore inhibition of KIAA1598 (Accession NM\_018330). Accordingly, utilities of VGAM713 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1598. KIAA1607 (Accession XM\_033379) is another VGAM713 host target gene. KIAA1607 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1607, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1607 BINDING SITE, designated SEQ ID:31914, to the

nucleotide sequence of VGAM713 RNA, herein designated VGAM RNA, also designated SEQ ID:3424.

[28672] Another function of VGAM713 is therefore inhibition of KIAA1607 (Accession XM\_033379). Accordingly, utilities of VGAM713 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1607. KIAA1911 (Accession XM\_056302) is another VGAM713 host target gene. KIAA1911 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1911, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1911 BINDING SITE, designated SEQ ID:36394, to the nucleotide sequence of VGAM713 RNA, herein designated VGAM RNA, also designated SEQ ID:3424.

[28673] Another function of VGAM713 is therefore inhibition of KIAA1911 (Accession XM\_056302). Accordingly, utilities of VGAM713 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1911. MGC10818 (Accession NM\_030568) is another VGAM713 host target gene. MGC10818 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by MGC10818, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC10818 BINDING SITE, designated SEQ ID:24941, to the nucleotide sequence of VGAM713 RNA, herein designated VGAM RNA, also designated SEQ ID:3424.

[28674] Another function of VGAM713 is therefore inhibition of MGC10818 (Accession NM\_030568). Accordingly, utilities of VGAM713 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10818. Monocyte to Macrophage Differentiation-associated (MMD, Accession XM\_008269) is another VGAM713 host target gene. MMD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MMD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MMD BINDING SITE, designated SEQ ID:30076, to the nucleotide sequence of VGAM713 RNA, herein designated VGAM RNA, also designated SEQ ID:3424.

[28675] Another function of VGAM713 is therefore inhibition of

Monocyte to Macrophage Differentiation-associated (MMD, Accession XM\_008269). Accordingly, utilities of VGAM713 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MMD. RAP2B, Member of RAS Oncogene Family (RAP2B, Accession XM\_171061) is another VGAM713 host target gene. RAP2B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAP2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAP2B BINDING SITE, designated SEQ ID:45862, to the nucleotide sequence of VGAM713 RNA, herein designated VGAM RNA, also designated SEQ ID:3424.

[28676] Another function of VGAM713 is therefore inhibition of RAP2B, Member of RAS Oncogene Family (RAP2B, Accession XM\_171061). Accordingly, utilities of VGAM713 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAP2B. SEC15B (Accession XM\_039570) is another VGAM713 host target gene. SEC15B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

SEC15B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEC15B BINDING SITE, designated SEQ ID:33130, to the nucleotide sequence of VGAM713 RNA, herein designated VGAM RNA, also designated SEQ ID:3424.

[28677] Another function of VGAM713 is therefore inhibition of SEC15B (Accession XM\_039570). Accordingly, utilities of VGAM713 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEC15B. Tripartite Motif-containing 26 (TRIM26, Accession NM\_003449) is another VGAM713 host target gene. TRIM26 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRIM26, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM26 BINDING SITE, designated SEQ ID:9500, to the nucleotide sequence of VGAM713 RNA, herein designated VGAM RNA, also designated SEQ ID:3424.

[28678] Another function of VGAM713 is therefore inhibition of

Tripartite Motif-containing 26 (TRIM26, Accession NM\_003449). Accordingly, utilities of VGAM713 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM26. TU3A (Accession NM\_007177) is another VGAM713 host target gene. TU3A BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TU3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TU3A BINDING SITE, designated SEQ ID:14037, to the nucleotide sequence of VGAM713 RNA, herein designated VGAM RNA, also designated SEQ ID:3424.

[28679] Another function of VGAM713 is therefore inhibition of TU3A (Accession NM\_007177). Accordingly, utilities of VGAM713 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TU3A. ZER6 (Accession XM\_032742) is another VGAM713 host target gene. ZER6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZER6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of ZER6 BINDING SITE, designated SEQ ID:31743, to the nucleotide sequence of VGAM713 RNA, herein designated VGAM RNA, also designated SEQ ID:3424.

[28680] Another function of VGAM713 is therefore inhibition of ZER6 (Accession XM\_032742). Accordingly, utilities of VGAM713 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZER6. Zinc Finger Protein 337 (ZNF337, Accession XM\_042807) is another VGAM713 host target gene. ZNF337 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF337, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF337 BINDING SITE, designated SEQ ID:33772, to the nucleotide sequence of VGAM713 RNA, herein designated VGAM RNA, also designated SEQ ID:3424.

[28681] Another function of VGAM713 is therefore inhibition of Zinc Finger Protein 337 (ZNF337, Accession XM\_042807). Accordingly, utilities of VGAM713 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF337. LOC127702 (Accession

XM\_060619) is another VGAM713 host target gene.

LOC127702 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC127702, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC127702 BINDING SITE, designated SEQ ID:37184, to the nucleotide sequence of VGAM713 RNA, herein designated VGAM RNA, also designated SEQ ID:3424.

[28682] Another function of VGAM713 is therefore inhibition of LOC127702 (Accession XM\_060619). Accordingly, utilities of VGAM713 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC127702. LOC146669 (Accession XM\_085534) is another VGAM713 host target gene. LOC146669 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146669, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146669 BINDING SITE, designated SEQ ID:38224, to the nucleotide sequence of VGAM713 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3424.

[28683] Another function of VGAM713 is therefore inhibition of LOC146669 (Accession XM\_085534). Accordingly, utilities of VGAM713 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146669. LOC146856 (Accession XM\_096086) is another VGAM713 host target gene. LOC146856 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146856, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146856 BINDING SITE, designated SEQ ID:40300, to the nucleotide sequence of VGAM713 RNA, herein designated VGAM RNA, also designated SEQ ID:3424.

[28684] Another function of VGAM713 is therefore inhibition of LOC146856 (Accession XM\_096086). Accordingly, utilities of VGAM713 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146856. LOC150225 (Accession XM\_097870) is another VGAM713 host target gene. LOC150225 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150225, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150225 BINDING SITE, designated SEQ ID:41192, to the nucleotide sequence of VGAM713 RNA, herein designated VGAM RNA, also designated SEQ ID:3424.

[28685] Another function of VGAM713 is therefore inhibition of LOC150225 (Accession XM\_097870). Accordingly, utilities of VGAM713 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150225. LOC150406 (Accession XM\_086908) is another VGAM713 host target gene. LOC150406 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150406, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150406 BINDING SITE, designated SEQ ID:38965, to the nucleotide sequence of VGAM713 RNA, herein designated VGAM RNA, also designated SEQ ID:3424.

[28686] Another function of VGAM713 is therefore inhibition of LOC150406 (Accession XM\_086908). Accordingly, utilities of VGAM713 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC150406. LOC152300 (Accession XM\_087432) is another VGAM713 host target gene. LOC152300 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152300, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152300 BINDING SITE, designated SEQ ID:39253, to the nucleotide sequence of VGAM713 RNA, herein designated VGAM RNA, also designated SEQ ID:3424.

[28687] Another function of VGAM713 is therefore inhibition of LOC152300 (Accession XM\_087432). Accordingly, utilities of VGAM713 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152300. LOC154790 (Accession XM\_088044) is another VGAM713 host target gene. LOC154790 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC154790, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154790 BINDING SITE, designated SEQ ID:39491, to

the nucleotide sequence of VGAM713 RNA, herein designated VGAM RNA, also designated SEQ ID:3424.

[28688] Another function of VGAM713 is therefore inhibition of LOC154790 (Accession XM\_088044). Accordingly, utilities of VGAM713 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154790. LOC155081 (Accession XM\_088145) is another VGAM713 host target gene. LOC155081 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC155081, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155081 BINDING SITE, designated SEQ ID:39544, to the nucleotide sequence of VGAM713 RNA, herein designated VGAM RNA, also designated SEQ ID:3424.

[28689] Another function of VGAM713 is therefore inhibition of LOC155081 (Accession XM\_088145). Accordingly, utilities of VGAM713 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155081. LOC170372 (Accession XM\_084317) is another VGAM713 host target gene. LOC170372 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC170372, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC170372 BINDING SITE, designated SEQ ID:37540, to the nucleotide sequence of VGAM713 RNA, herein designated VGAM RNA, also designated SEQ ID:3424.

[28690] Another function of VGAM713 is therefore inhibition of LOC170372 (Accession XM\_084317). Accordingly, utilities of VGAM713 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC170372. LOC170425 (Accession XM\_084330) is another VGAM713 host target gene. LOC170425 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC170425, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC170425 BINDING SITE, designated SEQ ID:37553, to the nucleotide sequence of VGAM713 RNA, herein designated VGAM RNA, also designated SEQ ID:3424.

[28691] Another function of VGAM713 is therefore inhibition of LOC170425 (Accession XM\_084330). Accordingly, utilities

of VGAM713 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC170425. LOC202802 (Accession XM\_114560) is another VGAM713 host target gene. LOC202802 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC202802, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202802 BINDING SITE, designated SEQ ID:42989, to the nucleotide sequence of VGAM713 RNA, herein designated VGAM RNA, also designated SEQ ID:3424.

[28692] Another function of VGAM713 is therefore inhibition of LOC202802 (Accession XM\_114560). Accordingly, utilities of VGAM713 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202802. LOC221810 (Accession XM\_168222) is another VGAM713 host target gene. LOC221810 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221810, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC221810 BINDING SITE, designated SEQ ID:45086, to the nucleotide sequence of VGAM713 RNA, herein designated VGAM RNA, also designated SEQ ID:3424.

[28693] Another function of VGAM713 is therefore inhibition of LOC221810 (Accession XM\_168222). Accordingly, utilities of VGAM713 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221810. LOC222228 (Accession XM\_168627) is another VGAM713 host target gene. LOC222228 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222228, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222228 BINDING SITE, designated SEQ ID:45275, to the nucleotide sequence of VGAM713 RNA, herein designated VGAM RNA, also designated SEQ ID:3424.

[28694] Another function of VGAM713 is therefore inhibition of LOC222228 (Accession XM\_168627). Accordingly, utilities of VGAM713 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222228. LOC222233 (Accession XM\_168560) is another VGAM713 host target gene. LOC222233 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222233, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222233 BINDING SITE, designated SEQ ID:45244, to the nucleotide sequence of VGAM713 RNA, herein designated VGAM RNA, also designated SEQ ID:3424.

[28695] Another function of VGAM713 is therefore inhibition of LOC222233 (Accession XM\_168560). Accordingly, utilities of VGAM713 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222233. LOC253502 (Accession XM\_170561) is another VGAM713 host target gene. LOC253502 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253502, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253502 BINDING SITE, designated SEQ ID:45381, to the nucleotide sequence of VGAM713 RNA, herein designated VGAM RNA, also designated SEQ ID:3424.

[28696] Another function of VGAM713 is therefore inhibition of

LOC253502 (Accession XM\_170561). Accordingly, utilities of VGAM713 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253502. LOC255242 (Accession XM\_171095) is another VGAM713 host target gene. LOC255242 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255242, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255242 BINDING SITE, designated SEQ ID:45906, to the nucleotide sequence of VGAM713 RNA, herein designated VGAM RNA, also designated SEQ ID:3424.

[28697] Another function of VGAM713 is therefore inhibition of LOC255242 (Accession XM\_171095). Accordingly, utilities of VGAM713 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255242. LOC257494 (Accession XM\_175212) is another VGAM713 host target gene. LOC257494 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257494, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC257494 BINDING SITE, designated SEQ ID:46687, to the nucleotide sequence of VGAM713 RNA, herein designated VGAM RNA, also designated SEQ ID:3424.

[28698] Another function of VGAM713 is therefore inhibition of LOC257494 (Accession XM\_175212). Accordingly, utilities of VGAM713 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257494. LOC57115 (Accession NM\_020393) is another VGAM713 host target gene. LOC57115 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC57115, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC57115 BINDING SITE, designated SEQ ID:21663, to the nucleotide sequence of VGAM713 RNA, herein designated VGAM RNA, also designated SEQ ID:3424.

[28699] Another function of VGAM713 is therefore inhibition of LOC57115 (Accession NM\_020393). Accordingly, utilities of VGAM713 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC57115. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 714 (VGAM714) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28700] VGAM714 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM714 was detected is described hereinabove with reference to Figs. 1–8.

[28701] VGAM714 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Herpesvirus 4. VGAM714 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28702] VGAM714 gene encodes a VGAM714 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM714 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM714 precursor RNA is designated SEQ ID:700, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:700 is

located at position 102811 relative to the genome of Bovine Herpesvirus 4.

[28703] VGAM714 precursor RNA folds onto itself, forming VGAM714 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28704] An enzyme complex designated DICER COMPLEX, `dices` the VGAM714 folded precursor RNA into VGAM714 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 74%) nucleotide sequence of VGAM714 RNA is designated SEQ ID:3425, and is provided hereinbelow with reference to the sequence listing part.

[28705] VGAM714 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM714 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM714 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[28706] VGAM714 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM714 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM714 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM714 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM714 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[28707] The complementary binding of VGAM714 RNA, herein designated VGAM RNA, to host target binding sites on VGAM714 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM714 host target RNA into VGAM714 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28708] It is appreciated that VGAM714 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM714 host target genes. The mRNA of each one of this plurality of VGAM714 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM714 RNA, herein designated VGAM RNA, and which when bound by VGAM714 RNA causes inhibition of translation of respective one or more VGAM714

host target proteins.

[28709] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM714 gene, herein designated VGAM GENE, on one or more VGAM714 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[28710] It is yet further appreciated that a function of VGAM714 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM714 include diagnosis, prevention and treatment of viral infection by Bovine Herpesvirus 4. Spe-

cific functions, and accordingly utilities, of VGAM714 correlate with, and may be deduced from, the identity of the host target genes which VGAM714 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28711] Nucleotide sequences of the VGAM714 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM714 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM714 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM714 are further described hereinbelow with reference to Table 1.

[28712] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM714 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM714 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28713] As mentioned hereinabove with reference to Fig. 1, a function of VGAM714 gene, herein designated VGAM is inhibition of expression of VGAM714 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM714 correlate with, and may be deduced from, the identity of the target genes which VGAM714 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28714] Insulin-like Growth Factor Binding Protein 3 (IGFBP3, Accession NM\_000598) is a VGAM714 host target gene. IGFBP3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IGFBP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IGFBP3 BINDING SITE, designated SEQ ID:6200, to the nucleotide sequence of VGAM714 RNA, herein designated VGAM RNA, also designated SEQ ID:3425.

[28715] A function of VGAM714 is therefore inhibition of Insulin-like Growth Factor Binding Protein 3 (IGFBP3, Accession NM\_000598). Accordingly, utilities of VGAM714 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IGFBP3. Sulfotransferase Family, Cytosolic, 1C, Member 1 (SULT1C1, Accession NM\_001056) is another VGAM714 host target gene. SULT1C1 BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by SULT1C1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SULT1C1 BINDING SITE, designated SEQ ID:6723, to the nucleotide sequence of VGAM714 RNA, herein designated VGAM RNA, also designated SEQ ID:3425.

[28716] Another function of VGAM714 is therefore inhibition of Sulfotransferase Family, Cytosolic, 1C, Member 1 (SULT1C1, Accession NM\_001056). Accordingly, utilities of VGAM714 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SULT1C1. CGI-142 (Accession NM\_016073) is another VGAM714 host target gene. CGI-142 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CGI-142, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CGI-142 BINDING SITE, designated SEQ ID:18148, to the nucleotide sequence of VGAM714 RNA, herein designated VGAM RNA, also designated SEQ ID:3425.

[28717] Another function of VGAM714 is therefore inhibition of CGI-142 (Accession NM\_016073). Accordingly, utilities of VGAM714 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CGI-142. FLJ20783 (Accession NM\_017958) is another VGAM714 host target gene. FLJ20783 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20783, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20783 BINDING SITE, designated SEQ ID:19669, to the nucleotide sequence of VGAM714 RNA, herein designated VGAM RNA, also designated SEQ ID:3425.

[28718] Another function of VGAM714 is therefore inhibition of FLJ20783 (Accession NM\_017958). Accordingly, utilities of VGAM714 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20783. FLJ22625 (Accession NM\_024715) is another VGAM714 host target gene. FLJ22625 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22625, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

**BINDING SITE III.** Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22625 BINDING SITE, designated SEQ ID:24043, to the nucleotide sequence of VGAM714 RNA, herein designated VGAM RNA, also designated SEQ ID:3425.

[28719] Another function of VGAM714 is therefore inhibition of FLJ22625 (Accession NM\_024715). Accordingly, utilities of VGAM714 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22625. KIAA1966 (Accession NM\_133370) is another VGAM714 host target gene. KIAA1966 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1966, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1966 BINDING SITE, designated SEQ ID:28495, to the nucleotide sequence of VGAM714 RNA, herein designated VGAM RNA, also designated SEQ ID:3425.

[28720] Another function of VGAM714 is therefore inhibition of KIAA1966 (Accession NM\_133370). Accordingly, utilities of VGAM714 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1966. Lymphoid-restricted Membrane Protein (LRMP, Accession NM\_006152) is another VGAM714 host target gene. LRMP BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LRMP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LRMP BINDING SITE, designated SEQ ID:12806, to the nucleotide sequence of VGAM714 RNA, herein designated VGAM RNA, also designated SEQ ID:3425.

[28721] Another function of VGAM714 is therefore inhibition of Lymphoid-restricted Membrane Protein (LRMP, Accession NM\_006152). Accordingly, utilities of VGAM714 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LRMP. SV2 (Accession NM\_014849) is another VGAM714 host target gene. SV2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SV2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SV2 BINDING SITE, designated SEQ ID:16887, to the nucleotide sequence of VGAM714 RNA, herein designated

VGAM RNA, also designated SEQ ID:3425.

[28722] Another function of VGAM714 is therefore inhibition of SV2 (Accession NM\_014849). Accordingly, utilities of VGAM714 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SV2.

LOC152756 (Accession XM\_098262) is another VGAM714 host target gene. LOC152756 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152756, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152756 BINDING SITE, designated SEQ ID:41550, to the nucleotide sequence of VGAM714 RNA, herein designated VGAM RNA, also designated SEQ ID:3425.

[28723] Another function of VGAM714 is therefore inhibition of LOC152756 (Accession XM\_098262). Accordingly, utilities of VGAM714 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152756. LOC84549 (Accession NM\_032509) is another VGAM714 host target gene. LOC84549 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC84549, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC84549 BINDING SITE, designated SEQ ID:26256, to the nucleotide sequence of VGAM714 RNA, herein designated VGAM RNA, also designated SEQ ID:3425.

[28724] Another function of VGAM714 is therefore inhibition of LOC84549 (Accession NM\_032509). Accordingly, utilities of VGAM714 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC84549. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 715 (VGAM715) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28725] VGAM715 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM715 was detected is described hereinabove with reference to Figs. 1–8.

[28726] VGAM715 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine Her–

pesvirus 7. VGAM715 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28727] VGAM715 gene encodes a VGAM715 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM715 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM715 precursor RNA is designated SEQ ID:701, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:701 is located at position 36568 relative to the genome of Cercopithecine Herpesvirus 7.

[28728] VGAM715 precursor RNA folds onto itself, forming VGAM715 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28729] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM715 folded precursor RNA into VGAM715 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM715 RNA is designated SEQ ID:3426, and is provided hereinbelow with reference to the sequence listing part.

[28730] VGAM715 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM715 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM715 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[28731] VGAM715 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM715 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM715 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM715 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM715 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[28732] The complementary binding of VGAM715 RNA, herein designated VGAM RNA, to host target binding sites on VGAM715 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM715 host target RNA into VGAM715 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28733] It is appreciated that VGAM715 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM715 host target genes. The mRNA of each one of this plurality of VGAM715 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM715 RNA, herein designated VGAM RNA, and which when bound by VGAM715 RNA causes inhibition of translation of respective one or more VGAM715 host target proteins.

[28734] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM715 gene, herein designated VGAM GENE, on one or more VGAM715 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[28735] It is yet further appreciated that a function of VGAM715 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM715 include diagnosis, prevention and treatment of viral infection by Cercopithecine Herpesvirus 7. Specific functions, and accordingly utilities, of VGAM715 correlate with, and may be deduced from, the identity of the host target genes which VGAM715 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28736] Nucleotide sequences of the VGAM715 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM715 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM715 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM715 are further described hereinbelow with reference to Table 1.

[28737] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM715 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM715 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28738] As mentioned hereinabove with reference to Fig. 1, a function of VGAM715 gene, herein designated VGAM is inhibition of expression of VGAM715 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM715 correlate with, and may be deduced from, the identity of the target genes which VGAM715 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28739] FLJ11259 (Accession NM\_018370) is a VGAM715 host target gene. FLJ11259 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11259, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11259 BINDING SITE, designated SEQ ID:20386, to the nucleotide sequence of VGAM715

RNA, herein designated VGAM RNA, also designated SEQ ID:3426.

[28740] A function of VGAM715 is therefore inhibition of FLJ11259 (Accession NM\_018370). Accordingly, utilities of VGAM715 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11259. MGC10946 (Accession NM\_030572) is another VGAM715 host target gene. MGC10946 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC10946, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC10946 BINDING SITE, designated SEQ ID:24946, to the nucleotide sequence of VGAM715 RNA, herein designated VGAM RNA, also designated SEQ ID:3426.

[28741] Another function of VGAM715 is therefore inhibition of MGC10946 (Accession NM\_030572). Accordingly, utilities of VGAM715 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10946. LOC149650 (Accession XM\_086623) is another VGAM715 host target gene. LOC149650 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC149650, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149650 BINDING SITE, designated SEQ ID:38796, to the nucleotide sequence of VGAM715 RNA, herein designated VGAM RNA, also designated SEQ ID:3426.

[28742] Another function of VGAM715 is therefore inhibition of LOC149650 (Accession XM\_086623). Accordingly, utilities of VGAM715 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149650. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 716 (VGAM716) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28743] VGAM716 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM716 was detected is described hereinabove with reference to Figs. 1–8.

[28744] VGAM716 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Cercopithecine Herpesvirus 7. VGAM716 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28745] VGAM716 gene encodes a VGAM716 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM716 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM716 precursor RNA is designated SEQ ID:702, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:702 is located at position 34593 relative to the genome of Cercopithecine Herpesvirus 7.

[28746] VGAM716 precursor RNA folds onto itself, forming VGAM716 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28747] An enzyme complex designated DICER COMPLEX, `dices` the VGAM716 folded precursor RNA into VGAM716 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM716 RNA is designated SEQ ID:3427, and is provided hereinbelow with reference to the sequence listing part.

[28748] VGAM716 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM716 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM716 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[28749] VGAM716 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM716 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM716 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM716 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM716 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[28750] The complementary binding of VGAM716 RNA, herein designated VGAM RNA, to host target binding sites on VGAM716 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM716 host tar-

get RNA into VGAM716 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28751] It is appreciated that VGAM716 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM716 host target genes. The mRNA of each one of this plurality of VGAM716 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM716 RNA, herein designated VGAM RNA, and which when bound by VGAM716 RNA causes inhibition of translation of respective one or more VGAM716 host target proteins.

[28752] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM716 gene, herein designated VGAM GENE, on one or more VGAM716 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[28753] It is yet further appreciated that a function of VGAM716 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM716 include diagnosis, prevention and treatment of viral infection by Cercopithecine Herpesvirus 7. Specific functions, and accordingly utilities, of VGAM716 correlate with, and may be deduced from, the identity of the host target genes which VGAM716 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28754] Nucleotide sequences of the VGAM716 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM716 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM716 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM716 are further

described hereinbelow with reference to Table 1.

[28755] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM716 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM716 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28756] As mentioned hereinabove with reference to Fig. 1, a function of VGAM716 gene, herein designated VGAM is inhibition of expression of VGAM716 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM716 correlate with, and may be deduced from, the identity of the target genes which VGAM716 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28757] POU Domain, Class 3, Transcription Factor 1 (POU3F1, Accession XM\_001334) is a VGAM716 host target gene. POU3F1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by POU3F1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of POU3F1 BINDING SITE, designated SEQ ID:29830, to the nucleotide sequence of VGAM716 RNA, herein designated VGAM RNA, also designated SEQ ID:3427.

[28758] A function of VGAM716 is therefore inhibition of POU Domain, Class 3, Transcription Factor 1 (POU3F1, Accession XM\_001334), a gene which involves in early embryogenesis and neurogenesis. Accordingly, utilities of VGAM716 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POU3F1. The function of POU3F1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM85. Tropomodulin (TMOD, Accession NM\_003275) is another VGAM716 host target gene. TMOD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TMOD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TMOD BINDING SITE, designated SEQ ID:9293, to the nucleotide sequence of VGAM716 RNA, herein designated VGAM RNA, also designated SEQ ID:3427.

[28759] Another function of VGAM716 is therefore inhibition of Tropomodulin (TMOD, Accession NM\_003275), a gene which blocks the elongation and depolymerization of the actin filaments at the pointed end. Accordingly, utilities of VGAM716 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TMOD. The function of TMOD has been established by previous studies. Tropomodulin is associated with the pointed end of the actin filaments (Fowler et al., 1993). It binds specifically to the N terminus of tropomyosin and blocks the elongation and depolarization of tropomyosin-coated actin filaments. By Northern blot analysis, Sung et al. (1996) showed that the TMOD gene is expressed in major human tissues at different levels in the following order: heart and skeletal muscle much greater than in brain, lung, and pancreas, which is greater than in placenta, liver, and kidney. They pointed to structural similarities between tropomodulin and the 64-kD autoantigen in Graves disease (OMIM Ref. No. 139080) and suggested that the 2 genes evolved from a common ancestral gene. Chu et al. (2000) noted that erythrocyte TMOD is a 359-amino acid globular protein. Using PCR methods to obtain TMOD genomic clones, they determined that the

TMOD gene contains 9 exons. Chu et al. (2000) suggested that the use of alternative promoters may account for tissue-specific expression and regulation.

[28760] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[28761] Fowler, V. M.; Sussmann, M. A.; Miller, P. G.; Flucher, B. E.; Daniels, M. P. : Tropomodulin is associated with the free (pointed) ends of the thin filaments in rat skeletal muscle. J. Cell Biol. 120: 411–420, 1993. ; and

[28762] Chu, X.; Thompson, D.; Yee, L. J.; Sung, L. A. : Genomic organization of mouse and human erythrocyte tropomodulin genes encoding the pointed end capping protein for the actin filaments.

[28763] Further studies establishing the function and utilities of TMOD are found in John Hopkins OMIM database record ID 190930, and in cited publications numbered 3262–3265, 80 and 3266–3270 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Zinc Finger Protein 80 (pT17) (ZNF80, Accession NM\_007136) is another VGAM716 host target gene. ZNF80 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ZNF80,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF80 BINDING SITE, designated SEQ ID:13987, to the nucleotide sequence of VGAM716 RNA, herein designated VGAM RNA, also designated SEQ ID:3427.

[28764] Another function of VGAM716 is therefore inhibition of Zinc Finger Protein 80 (pT17) (ZNF80, Accession NM\_007136). Accordingly, utilities of VGAM716 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF80. Lysyl Oxidase-like 4 (LOXL4, Accession NM\_032211) is another VGAM716 host target gene. LOXL4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOXL4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOXL4 BINDING SITE, designated SEQ ID:25927, to the nucleotide sequence of VGAM716 RNA, herein designated VGAM RNA, also designated SEQ ID:3427.

[28765] Another function of VGAM716 is therefore inhibition of

Lysyl Oxidase-like 4 (LOXL4, Accession NM\_032211). Accordingly, utilities of VGAM716 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOXL4. Sideroflexin 2 (SFXN2, Accession XM\_058359) is another VGAM716 host target gene. SFXN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SFXN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SFXN2 BINDING SITE, designated SEQ ID:36605, to the nucleotide sequence of VGAM716 RNA, herein designated VGAM RNA, also designated SEQ ID:3427.

[28766] Another function of VGAM716 is therefore inhibition of Sideroflexin 2 (SFXN2, Accession XM\_058359). Accordingly, utilities of VGAM716 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFXN2. LOC145814 (Accession XM\_085243) is another VGAM716 host target gene. LOC145814 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145814, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC145814 BINDING SITE, designated SEQ ID:37986, to the nucleotide sequence of VGAM716 RNA, herein designated VGAM RNA, also designated SEQ ID:3427.

[28767] Another function of VGAM716 is therefore inhibition of LOC145814 (Accession XM\_085243). Accordingly, utilities of VGAM716 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145814. LOC147042 (Accession XM\_097167) is another VGAM716 host target gene. LOC147042 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147042, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147042 BINDING SITE, designated SEQ ID:40786, to the nucleotide sequence of VGAM716 RNA, herein designated VGAM RNA, also designated SEQ ID:3427.

[28768] Another function of VGAM716 is therefore inhibition of LOC147042 (Accession XM\_097167). Accordingly, utilities of VGAM716 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147042. LOC196540 (Accession XM\_116933) is an-

other VGAM716 host target gene. LOC196540 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196540, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196540 BINDING SITE, designated SEQ ID:43149, to the nucleotide sequence of VGAM716 RNA, herein designated VGAM RNA, also designated SEQ ID:3427.

[28769] Another function of VGAM716 is therefore inhibition of LOC196540 (Accession XM\_116933). Accordingly, utilities of VGAM716 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196540. LOC51141 (Accession XM\_043953) is another VGAM716 host target gene. LOC51141 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51141, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51141 BINDING SITE, designated SEQ ID:34046, to the nucleotide sequence of VGAM716 RNA, herein designated VGAM RNA, also designated SEQ ID:3427.

[28770] Another function of VGAM716 is therefore inhibition of LOC51141 (Accession XM\_043953). Accordingly, utilities of VGAM716 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51141. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 717 (VGAM717) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28771] VGAM717 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM717 was detected is described hereinabove with reference to Figs. 1–8.

[28772] VGAM717 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine Herpesvirus 7. VGAM717 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28773] VGAM717 gene encodes a VGAM717 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM717

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM717 precursor RNA is designated SEQ ID:703, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:703 is located at position 37440 relative to the genome of Cercopithecine Herpesvirus 7.

[28774] VGAM717 precursor RNA folds onto itself, forming VGAM717 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28775] An enzyme complex designated DICER COMPLEX, `dices` the VGAM717 folded precursor RNA into VGAM717 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 79%) nucleotide sequence of VGAM717 RNA is designated SEQ ID:3428, and is provided hereinbelow with reference to the sequence listing part.

[28776] VGAM717 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM717 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM717 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[28777] VGAM717 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM717 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM717 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM717 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM717 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[28778] The complementary binding of VGAM717 RNA, herein designated VGAM RNA, to host target binding sites on VGAM717 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM717 host target RNA into VGAM717 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28779] It is appreciated that VGAM717 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM717 host target genes. The mRNA of each one of this plurality of VGAM717 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM717 RNA, herein designated VGAM RNA, and which when bound by VGAM717 RNA causes inhibition of translation of respective one or more VGAM717 host target proteins.

[28780] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM717 gene, herein designated VGAM GENE, on one or more VGAM717 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[28781] It is yet further appreciated that a function of VGAM717 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM717 include diagnosis, prevention and treatment of viral infection by Cercopithecine Herpesvirus 7. Specific functions, and accordingly utilities, of VGAM717 correlate with, and may be deduced from, the identity of the host target genes which VGAM717 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28782] Nucleotide sequences of the VGAM717 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM717 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM717 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM717 are further described hereinbelow with reference to Table 1.

[28783] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM717 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM717 RNA, herein designated VGAM RNA, are described hereinbelow with refer-

ence to Table 2.

[28784] As mentioned hereinabove with reference to Fig. 1, a function of VGAM717 gene, herein designated VGAM is inhibition of expression of VGAM717 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM717 correlate with, and may be deduced from, the identity of the target genes which VGAM717 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28785] B-cell CLL/lymphoma 2 (BCL2, Accession NM\_000633) is a VGAM717 host target gene. BCL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BCL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL2 BINDING SITE, designated SEQ ID:6255, to the nucleotide sequence of VGAM717 RNA, herein designated VGAM RNA, also designated SEQ ID:3428.

[28786] A function of VGAM717 is therefore inhibition of B-cell CLL/lymphoma 2 (BCL2, Accession NM\_000633). Accordingly, utilities of VGAM717 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with BCL2. LOC120939 (Accession XM\_073688) is another VGAM717 host target gene. LOC120939 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC120939, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC120939 BINDING SITE, designated SEQ ID:37515, to the nucleotide sequence of VGAM717 RNA, herein designated VGAM RNA, also designated SEQ ID:3428.

[28787] Another function of VGAM717 is therefore inhibition of LOC120939 (Accession XM\_073688). Accordingly, utilities of VGAM717 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC120939. LOC143381 (Accession XM\_084501) is another VGAM717 host target gene. LOC143381 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC143381, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143381 BINDING SITE, designated SEQ ID:37612, to the nucleotide sequence of VGAM717 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3428.

[28788] Another function of VGAM717 is therefore inhibition of LOC143381 (Accession XM\_084501). Accordingly, utilities of VGAM717 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143381. LOC257095 (Accession XM\_173058) is another VGAM717 host target gene. LOC257095 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257095, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257095 BINDING SITE, designated SEQ ID:46312, to the nucleotide sequence of VGAM717 RNA, herein designated VGAM RNA, also designated SEQ ID:3428.

[28789] Another function of VGAM717 is therefore inhibition of LOC257095 (Accession XM\_173058). Accordingly, utilities of VGAM717 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257095. LOC51055 (Accession NM\_015901) is another VGAM717 host target gene. LOC51055 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC51055, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51055 BINDING SITE, designated SEQ ID:18044, to the nucleotide sequence of VGAM717 RNA, herein designated VGAM RNA, also designated SEQ ID:3428.

[28790] Another function of VGAM717 is therefore inhibition of LOC51055 (Accession NM\_015901). Accordingly, utilities of VGAM717 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51055. LOC92597 (Accession XM\_046066) is another VGAM717 host target gene. LOC92597 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92597, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92597 BINDING SITE, designated SEQ ID:34673, to the nucleotide sequence of VGAM717 RNA, herein designated VGAM RNA, also designated SEQ ID:3428.

[28791] Another function of VGAM717 is therefore inhibition of LOC92597 (Accession XM\_046066). Accordingly, utilities of VGAM717 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC92597. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 718 (VGAM718) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28792] VGAM718 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM718 was detected is described hereinabove with reference to Figs. 1–8.

[28793] VGAM718 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine Herpesvirus 7. VGAM718 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28794] VGAM718 gene encodes a VGAM718 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM718 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM718 precursor RNA is designated SEQ

ID:704, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:704 is located at position 39450 relative to the genome of Cercopithecine Herpesvirus 7.

[28795] VGAM718 precursor RNA folds onto itself, forming VGAM718 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28796] An enzyme complex designated DICER COMPLEX, `dices` the VGAM718 folded precursor RNA into VGAM718 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 64%) nucleotide sequence of VGAM718 RNA is designated SEQ ID:3429, and is provided hereinbelow with reference to the sequence

listing part.

[28797] VGAM718 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM718 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM718 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[28798] VGAM718 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM718 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM718 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM718 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM718 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[28799] The complementary binding of VGAM718 RNA, herein designated VGAM RNA, to host target binding sites on VGAM718 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM718 host target RNA into VGAM718 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28800] It is appreciated that VGAM718 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM718 host target genes. The mRNA of each one of this plurality of VGAM718 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM718 RNA, herein designated VGAM

RNA, and which when bound by VGAM718 RNA causes inhibition of translation of respective one or more VGAM718 host target proteins.

[28801] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM718 gene, herein designated VGAM GENE, on one or more VGAM718 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[28802] It is yet further appreciated that a function of VGAM718 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM718 include diagnosis, prevention and treatment of viral infection by Cercopithecine Herpesvirus 7. Specific functions, and accordingly utilities, of VGAM718 correlate with, and may be deduced from, the identity of the host target genes which VGAM718 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28803] Nucleotide sequences of the VGAM718 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM718 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM718 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM718 are further described hereinbelow with reference to Table 1.

[28804] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM718 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM718 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28805] As mentioned hereinabove with reference to Fig. 1, a function of VGAM718 gene, herein designated VGAM is

inhibition of expression of VGAM718 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM718 correlate with, and may be deduced from, the identity of the target genes which VGAM718 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28806] Fibrinogen, A Alpha Polypeptide (FGA, Accession NM\_000508) is a VGAM718 host target gene. FGA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FGA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGA BINDING SITE, designated SEQ ID:6118, to the nucleotide sequence of VGAM718 RNA, herein designated VGAM RNA, also designated SEQ ID:3429.

[28807] A function of VGAM718 is therefore inhibition of Fibrinogen, A Alpha Polypeptide (FGA, Accession NM\_000508). Accordingly, utilities of VGAM718 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGA. Pleiomorphic Adenoma Gene-like 2 (PLAGL2, Accession XM\_047007) is another VGAM718 host target gene. PLAGL2 BINDING SITE is HOST TARGET

binding site found in the 3` untranslated region of mRNA encoded by PLAGL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLAGL2 BINDING SITE, designated SEQ ID:34872, to the nucleotide sequence of VGAM718 RNA, herein designated VGAM RNA, also designated SEQ ID:3429.

[28808] Another function of VGAM718 is therefore inhibition of Pleiomorphic Adenoma Gene-like 2 (PLAGL2, Accession XM\_047007). Accordingly, utilities of VGAM718 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLAGL2. LOC256112 (Accession XM\_172829) is another VGAM718 host target gene. LOC256112 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC256112, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256112 BINDING SITE, designated SEQ ID:46101, to the nucleotide sequence of VGAM718 RNA, herein designated VGAM RNA, also designated SEQ ID:3429.

[28809] Another function of VGAM718 is therefore inhibition of LOC256112 (Accession XM\_172829). Accordingly, utilities of VGAM718 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256112. LOC92979 (Accession NM\_138396) is another VGAM718 host target gene. LOC92979 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92979, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92979 BINDING SITE, designated SEQ ID:28765, to the nucleotide sequence of VGAM718 RNA, herein designated VGAM RNA, also designated SEQ ID:3429.

[28810] Another function of VGAM718 is therefore inhibition of LOC92979 (Accession NM\_138396). Accordingly, utilities of VGAM718 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92979. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 719 (VGAM719) viral gene, which modulates expression of respective host target genes thereof,

the function and utility of which host target genes is known in the art.

[28811] VGAM719 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM719 was detected is described hereinabove with reference to Figs. 1–8.

[28812] VGAM719 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectocarpus Siliculosus Virus. VGAM719 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28813] VGAM719 gene encodes a VGAM719 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM719 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM719 precursor RNA is designated SEQ ID:705, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:705 is located at position 32262 relative to the genome of Ectocarpus Siliculosus Virus.

[28814] VGAM719 precursor RNA folds onto itself, forming VGAM719 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, which has a two-dimensional  
`hairpin structure`. As is well known in the art, this  
`hairpin structure`, is typical of RNA encoded by miRNA  
genes, and is due to the fact that the nucleotide sequence  
of the first half of the RNA encoded by a miRNA gene is an  
accurate or partial inversed-reversed sequence of the nu-  
cleotide sequence of the second half thereof.

[28815] An enzyme complex designated DICER COMPLEX, `dices`  
the VGAM719 folded precursor RNA into VGAM719 RNA,  
herein designated VGAM RNA, a single stranded ~22 nt  
long RNA segment. As is known in the art, `dicing` of a  
hairpin structured RNA precursor product into a short  
~22nt RNA segment is catalyzed by an enzyme complex  
comprising an enzyme called Dicer together with other  
necessary proteins. A probable (over 44%) nucleotide se-  
quence of VGAM719 RNA is designated SEQ ID:3430, and  
is provided hereinbelow with reference to the sequence  
listing part.

[28816] VGAM719 host target gene, herein designated VGAM  
HOST TARGET GENE, encodes a corresponding messenger  
RNA, VGAM719 host target RNA, herein designated VGAM  
HOST TARGET RNA. VGAM719 host target RNA comprises  
three regions, as is typical of mRNA of a protein coding

gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[28817] VGAM719 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM719 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM719 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM719 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM719 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[28818] The complementary binding of VGAM719 RNA, herein designated VGAM RNA, to host target binding sites on VGAM719 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM719 host target RNA into VGAM719 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28819] It is appreciated that VGAM719 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM719 host target genes. The mRNA of each one of this plurality of VGAM719 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM719 RNA, herein designated VGAM RNA, and which when bound by VGAM719 RNA causes inhibition of translation of respective one or more VGAM719 host target proteins.

[28820] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM719 gene, herein designated VGAM GENE, on one or more VGAM719 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[28821] It is yet further appreciated that a function of VGAM719 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM719 include diagnosis, prevention and treatment of viral infection by Ectocarpus Siliculosus Virus. Specific functions, and accordingly utilities, of VGAM719 correlate with, and may be deduced from, the identity of the host target genes which VGAM719 binds and inhibits, and the function of these host target genes,

as elaborated hereinbelow.

[28822] Nucleotide sequences of the VGAM719 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM719 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM719 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM719 are further described hereinbelow with reference to Table 1.

[28823] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM719 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM719 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28824] As mentioned hereinabove with reference to Fig. 1, a function of VGAM719 gene, herein designated VGAM is inhibition of expression of VGAM719 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM719 correlate with, and may be deduced from, the identity of the target genes which VGAM719 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28825] Fibroblast Growth Factor 4 (heparin secretory transforming protein 1, Kaposi sarcoma oncogene) (FGF4, Accession NM\_002007) is a VGAM719 host target gene. FGF4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FGF4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGF4 BINDING SITE, designated SEQ ID:7745, to the nucleotide sequence of VGAM719 RNA, herein designated VGAM RNA, also designated SEQ ID:3430.

[28826] A function of VGAM719 is therefore inhibition of Fibroblast Growth Factor 4 (heparin secretory transforming protein 1, Kaposi sarcoma oncogene) (FGF4, Accession NM\_002007), a gene which can transform nih 3t3 cells from a human stomach tumor (hst) and from kaposi's sarcoma (ks3). Accordingly, utilities of VGAM719 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGF4. The function of FGF4 has been established by previous studies. Sakamoto et al. (1986) tested the capacity for malignant transformation of DNA from 21 stomach cancers, 16 stomach cancers metastatic to lymph nodes, and 21 specimens of appar-

ently noncancerous stomach mucosa from a total of 26 patients with stomach cancer. The DNA was transferred to NIH 3T3 cells by the calcium precipitation technique. Transforming ability was shown by 3 samples: a primary cancer, a metastatic cancer, and a presumably normal gastric mucosa. The transforming gene from the primary cancer was cloned. It bore no homology with previously reported transforming sequences. Taira et al. (1987) isolated an HST cDNA clone that had an efficient transforming activity in a focus-forming assay when it was inserted into an expression vector. Characterization of this clone allowed Taira et al. (1987) to predict that a 206-amino acid protein product was responsible for this transforming activity. In an addendum, Taira et al. (1987) indicated that 42.3% homology existed between the amino acid residues of 1 ORF (open reading frame) of HST and part of bovine basic fibroblast growth factor. They suggested that further studies would elucidate the role of the HST gene in the development of stomach cancer which, they stated, has the highest incidence of all known cancers. By in situ hybridization, Adelaide et al. (1988) mapped the HST gene to chromosome 11q13. This is also the location of the INT2 gene. Furthermore, Adelaide et al. (1988) found the

2 genes to be coamplified in a human melanoma. Huebner et al. (1988) mapped the K-FGF oncogene to 11q11-q23 by hybridization studies using DNA from rodent-human somatic cell hybrids and then localized it more precisely to 11q13 by in situ hybridization. The 11q13 region is also the site of the BCL1 gene (OMIM Ref. No. 168461), which is involved in the 11;14 translocation characteristic of some B-cell tumors; see 151400. The oncogene SEA (OMIM Ref. No. 165110) has also been mapped to 11q13. By pulsed-field gel electrophoresis and by analysis of overlapping cosmid clones, Wada et al. (1988) concluded that HST1 is located about 35 kb downstream of INT2 in the same transcriptional orientation. Animal model experiments lend further support to the function of FGF4. Feldman et al. (1995) demonstrated that Fgf4  $-/-$  embryos die on embryonic day 5.0. To circumvent this early lethality and assess Fgf4 function in limb development, Sun et al. (2000) used the Cre/loxP system and found that Shh expression is maintained and limb formation is normal when Fgf4 is inactivated in mouse limbs, contradicting another model which suggested that Fgf4 expression is not maintained in Shh  $-/-$  mouse limbs. Sun et al. (2000) also found that maintenance of Fgf9 (OMIM Ref. No. 600921)

and Fgf17 (OMIM Ref. No. 603725) expression is dependent on Shh, whereas Fgf8 (OMIM Ref. No. 600483) expression is not. Sun et al. (2000) developed a model in which no individual Fgf expressed in the apical ectodermal ridge is solely necessary to maintain Shh expression, but instead the combined activity of 2 or more apical ectodermal ridge Fgfs function in a positive feedback loop with Shh to control limb development.

[28827] It is appreciated that the abovementioned animal model for FGF4 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[28828] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[28829] Taira, M.; Yoshida, T.; Miyagawa, K.; Sakamoto, H.; Terada, M.; Sugimura, T. : cDNA sequence of human transforming gene hst and identification of the coding sequence required for transforming activity. Proc. Nat. Acad. Sci. 84: 2980–2984, 1987. ; and

[28830] Huebner, K.; Ferrari, A. C.; Delli Bovi, P.; Croce, C. M.; Basilico, C. : The FGF-related oncogene, K-FGF, maps to human chromosome region 11q13, possibly near int-2.

Oncogene Res. 3: 26.

[28831] Further studies establishing the function and utilities of FGF4 are found in John Hopkins OMIM database record ID 164980, and in cited publications numbered 3284–3287, 2604, 3288–3290, 11445, 11531–1153 and 2130 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Natriuretic Peptide Receptor A/guanylate Cyclase A (atrionatriuretic peptide receptor A) (NPR1, Accession XM\_113360) is another VGAM719 host target gene. NPR1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NPR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NPR1 BINDING SITE, designated SEQ ID:42233, to the nucleotide sequence of VGAM719 RNA, herein designated VGAM RNA, also designated SEQ ID:3430.

[28832] Another function of VGAM719 is therefore inhibition of Natriuretic Peptide Receptor A/guanylate Cyclase A (atrionatriuretic peptide receptor A) (NPR1, Accession XM\_113360), a gene which has guanylate cyclase activity on binding of anp. Accordingly, utilities of VGAM719 in-

clude diagnosis, prevention and treatment of diseases and clinical conditions associated with NPR1. The function of NPR1 has been established by previous studies. The precursor of atrial natriuretic peptide (ANP; 108780) is produced and stored mainly in the right atrium of the heart (see OMIM Ref. No. Oliver et al., 1997). ANP formed from this precursor is released in response to atrial stretch. Once in the circulation, ANP binds to the natriuretic peptide receptor A (ANPRA, or NPR1), also known as guanylate cyclase A (or GC-A), mainly in the kidney, vascular tissue, and adrenal gland. This binding induces an increase in intracellular cGMP and initiates natriuresis, diuresis, and vasodilation, all of which contribute to lowering blood pressure. 'B-type' natriuretic peptide, a structurally related peptide formed mainly in the cardiac ventricles, also acts through ANPRA and has effects similar to ANP. Lowe et al. (1990) assigned the ANPRA gene to 1q12-qter by PCR analysis of genomic DNA from somatic cell hybrids. By in situ hybridization, the gene was further localized to 1q21-q22. Animal model experiments lend further support to the function of NPR1. To study the role of NPRA in the regulation of blood pressure and in the cardiovascular response to sustained hypertension, Oliver

et al. (1997) made mice completely lacking this receptor. They found that mice lacking a functional Npr1 gene coding for NPRA had elevated blood pressures and heart exhibiting marked hypertrophy with interstitial fibrosis resembling that seen in human hypertensive heart disease. Echocardiographic evaluation of the mice demonstrated a compensated state of systemic hypertension in which cardiac hypertrophy and dilatation were evident but with no reduction in ventricular performance. Nevertheless, sudden death, with morphologic evidence indicative in some animals of congestive heart failure and in others of aortic dissection, occurred in all 15 male mice lacking Npr1 before 6 months of age, and in 1 of 16 females in this study.

[28833] It is appreciated that the abovementioned animal model for NPR1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[28834] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[28835] Lowe, D. G.; Klisak, I.; Sparkes, R. S.; Mohandas, T.; Goedel, D. V. : Chromosomal distribution of three members of the human natriuretic peptide receptor/guanylyl cyclase

gene family. Genomics 8: 304–312, 1990. ; and

[28836] Oliver, P. M.; Fox, J. E.; Kim, R.; Rockman, H. A.; Kim, H.-S.; Reddick, R. L.; Pandey, K. N.; Milgram, S. L.; Smithies, O.; Maeda, N. : Hypertension, cardiac hypertrophy, and sudden dea.

[28837] Further studies establishing the function and utilities of NPR1 are found in John Hopkins OMIM database record ID 108960, and in cited publications numbered 4235–423 and 4318–4319 listed in the bibliography section herein–below, which are also hereby incorporated by reference. T-box, Brain, 1 (TBR1, Accession NM\_006593) is another VGAM719 host target gene. TBR1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TBR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TBR1 BINDING SITE, designated SEQ ID:13357, to the nucleotide sequence of VGAM719 RNA, herein designated VGAM RNA, also designated SEQ ID:3430.

[28838] Another function of VGAM719 is therefore inhibition of T-box, Brain, 1 (TBR1, Accession NM\_006593), a gene which is of unknown function. Accordingly, utilities of VGAM719

include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBR1. The function of TBR1 has been established by previous studies. Using subtractive hybridization of day 14.5 embryonic telencephalon and adult telencephalon, Bulfone et al. (1995) identified a mouse cDNA for Tbr1 (T-brain-1). Using mouse Tbr1 as a probe to screen a week 17 human fetal cDNA library, the authors identified a TBR1 cDNA encoding a 682-amino acid protein. The sequence of the TBR1 protein is 99% identical to the mouse sequence; both show high homology, particularly in the T-box DNA-binding domain, with the protein product of the T (Brachyury) gene (see OMIM Ref. No. 601397). Northern blot and in situ hybridization analyses revealed that expression of mouse Tbr1 is largely restricted to the cerebral cortex. It is expressed in postmitotic cells in the forebrain with onset during embryogenesis and continues to be expressed in the adult brain. Expression is 10-fold more abundant in embryonic than in adult tissue. To identify binding partners for the guanylate kinase domain of CASK (OMIM Ref. No. 300172), Hsueh et al. (2000) carried out a yeast 2-hybrid screen of brain cDNA libraries, from which TBR1 was isolated. By deletion analysis, the C-

terminal region of TBR1 (residues 342 to 681) was found to be necessary and sufficient for association with the guanylate kinase domain of CASK. When coexpressed in COS-7 cells, TBR1 and CASK were readily coprecipitated by antibodies directed against either individual protein. Hsueh et al. (2000) demonstrated that CASK enters the nucleus and binds to a specific DNA sequence (the T element) in a complex with TBR1. CASK acts as a coactivator of TBR1 to induce transcription of T element-containing genes, including reelin, a gene that is essential for cerebrocortical development.

[28839] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[28840] Bulfone, A.; Smiga, S. M.; Shimamura, K.; Peterson, A.; Puelles, L.; Rubenstein, J. L. R. : T-brain-1: a homolog of Brachyury whose expression defines molecularly distinct domains within the cerebral cortex. *Neuron* 15: 63-78, 1995. ; and

[28841] Hsueh, Y.-P.; Wang, T.-F.; Yang, F.-C.; Sheng, M. : Nuclear transcription and transcription regulation by the membrane-associated guanylate kinase CASK/LIN-2. *Nature* 404: 298-302, 2000.

[28842] Further studies establishing the function and utilities of TBR1 are found in John Hopkins OMIM database record ID 604616, and in cited publications numbered 504 and 7047 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. KIAA0125 (Accession XM\_018203) is another VGAM719 host target gene. KIAA0125 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0125, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0125 BINDING SITE, designated SEQ ID:30342, to the nucleotide sequence of VGAM719 RNA, herein designated VGAM RNA, also designated SEQ ID:3430.

[28843] Another function of VGAM719 is therefore inhibition of KIAA0125 (Accession XM\_018203). Accordingly, utilities of VGAM719 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0125. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 720 (VGAM720) viral gene, which modu-

lates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28844] VGAM720 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM720 was detected is described hereinabove with reference to Figs. 1–8.

[28845] VGAM720 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectocarpus Siliculosus Virus. VGAM720 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28846] VGAM720 gene encodes a VGAM720 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM720 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM720 precursor RNA is designated SEQ ID:706, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:706 is located at position 33937 relative to the genome of Ectocarpus Siliculosus Virus.

[28847] VGAM720 precursor RNA folds onto itself, forming

VGAM720 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28848] An enzyme complex designated DICER COMPLEX, `dices` the VGAM720 folded precursor RNA into VGAM720 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of VGAM720 RNA is designated SEQ ID:3431, and is provided hereinbelow with reference to the sequence listing part.

[28849] VGAM720 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM720 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM720 host target RNA comprises

three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[28850] VGAM720 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM720 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM720 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM720 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM720 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[28851] The complementary binding of VGAM720 RNA, herein designated VGAM RNA, to host target binding sites on VGAM720 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM720 host target RNA into VGAM720 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28852] It is appreciated that VGAM720 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM720 host target genes. The mRNA of each one of this plurality of VGAM720 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM720 RNA, herein designated VGAM RNA, and which when bound by VGAM720 RNA causes inhibition of translation of respective one or more VGAM720 host target proteins.

[28853] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM720 gene, herein designated VGAM GENE, on one or more VGAM720 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[28854] It is yet further appreciated that a function of VGAM720 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM720 include diagnosis, prevention and treatment of viral infection by Ectocarpus Siliculosus Virus. Specific functions, and accordingly utilities, of VGAM720 correlate with, and may be deduced from, the identity of the host target genes which VGAM720 binds

and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28855] Nucleotide sequences of the VGAM720 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM720 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM720 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM720 are further described hereinbelow with reference to Table 1.

[28856] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM720 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM720 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28857] As mentioned hereinabove with reference to Fig. 1, a function of VGAM720 gene, herein designated VGAM is inhibition of expression of VGAM720 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM720 correlate with, and may be deduced from, the identity of the target genes which VGAM720 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[28858] MLL Septin-like Fusion (MSF, Accession XM\_113892) is a VGAM720 host target gene. MSF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MSF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MSF BINDING SITE, designated SEQ ID:42520, to the nucleotide sequence of VGAM720 RNA, herein designated VGAM RNA, also designated SEQ ID:3431.

[28859] A function of VGAM720 is therefore inhibition of MLL Septin-like Fusion (MSF, Accession XM\_113892), a gene which plays a role in the cell cycle. Accordingly, utilities of VGAM720 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MSF. The function of MSF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM514. Carbohydrate (N-acetylgalactosamine 4-O) Sulfotransferase 8 (CHST8, Accession NM\_022467) is another VGAM720 host target gene. CHST8 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region

of mRNA encoded by CHST8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHST8 BINDING SITE, designated SEQ ID:22817, to the nucleotide sequence of VGAM720 RNA, herein designated VGAM RNA, also designated SEQ ID:3431.

[28860] Another function of VGAM720 is therefore inhibition of Carbohydrate (N-acetylgalactosamine 4-0) Sulfotransferase 8 (CHST8, Accession NM\_022467). Accordingly, utilities of VGAM720 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHST8. KIAA0435 (Accession NM\_014801) is another VGAM720 host target gene. KIAA0435 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0435, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0435 BINDING SITE, designated SEQ ID:16718, to the nucleotide sequence of VGAM720 RNA, herein designated VGAM RNA, also designated SEQ ID:3431.

[28861] Another function of VGAM720 is therefore inhibition of

KIAA0435 (Accession NM\_014801). Accordingly, utilities of VGAM720 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0435. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 721 (VGAM721) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28862] VGAM721 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM721 was detected is described hereinabove with reference to Figs. 1–8.

[28863] VGAM721 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tomato Mosaic Virus. VGAM721 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28864] VGAM721 gene encodes a VGAM721 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM721 precursor RNA does not encode a protein. A nucleotide

sequence identical or highly similar to the nucleotide sequence of VGAM721 precursor RNA is designated SEQ ID:707, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:707 is located at position 1715 relative to the genome of Tomato Mosaic Virus.

[28865] VGAM721 precursor RNA folds onto itself, forming VGAM721 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28866] An enzyme complex designated DICER COMPLEX, `dices` the VGAM721 folded precursor RNA into VGAM721 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide se-

quence of VGAM721 RNA is designated SEQ ID:3432, and is provided hereinbelow with reference to the sequence listing part.

[28867] VGAM721 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM721 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM721 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[28868] VGAM721 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM721 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM721 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM721 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM721 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[28869] The complementary binding of VGAM721 RNA, herein designated VGAM RNA, to host target binding sites on VGAM721 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM721 host target RNA into VGAM721 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28870] It is appreciated that VGAM721 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM721 host target genes. The mRNA of each one of this plurality of VGAM721 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM721 RNA, herein designated VGAM RNA, and which when bound by VGAM721 RNA causes inhibition of translation of respective one or more VGAM721 host target proteins.

[28871] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM721 gene, herein designated VGAM GENE, on one or more VGAM721 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[28872] It is yet further appreciated that a function of VGAM721 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM721 include diagnosis, prevention and treatment of viral infection by Tomato Mosaic Virus. Specific functions, and accordingly utilities, of VGAM721 correlate with, and may be deduced from, the identity of the host target genes which VGAM721 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28873] Nucleotide sequences of the VGAM721 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM721 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM721 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM721 are further described hereinbelow with reference to Table 1.

[28874] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM721 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM721 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28875] As mentioned hereinabove with reference to Fig. 1, a function of VGAM721 gene, herein designated VGAM is inhibition of expression of VGAM721 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM721 correlate with, and may be deduced from, the identity of the target genes which VGAM721 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28876] DNA (cytosine-5-)-methyltransferase 3 Beta (DNMT3B, Accession NM\_006892) is a VGAM721 host target gene. DNMT3B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DNMT3B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNMT3B BINDING SITE, designated SEQ ID:13758, to the nucleotide sequence of VGAM721 RNA, herein designated VGAM RNA, also designated SEQ ID:3432.

[28877] A function of VGAM721 is therefore inhibition of DNA (cytosine-5-)-methyltransferase 3 Beta (DNMT3B, Accession NM\_006892), a gene which is required for genome wide de novo methylation. Accordingly, utilities of

VGAM721 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNMT3B. The function of DNMT3B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM280. Oxidation Resistance 1 (OXR1, Accession NM\_018002) is another VGAM721 host target gene. OXR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OXR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OXR1 BINDING SITE, designated SEQ ID:19731, to the nucleotide sequence of VGAM721 RNA, herein designated VGAM RNA, also designated SEQ ID:3432.

[28878] Another function of VGAM721 is therefore inhibition of Oxidation Resistance 1 (OXR1, Accession NM\_018002). Accordingly, utilities of VGAM721 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OXR1. V-src Sarcoma (Schmidt-Ruppin A-2) Viral Oncogene Homolog (avian) (SRC, Accession NM\_005417) is another VGAM721 host target gene. SRC BINDING SITE is HOST TARGET binding site found in the

3' untranslated region of mRNA encoded by SRC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SRC BINDING SITE, designated SEQ ID:11886, to the nucleotide sequence of VGAM721 RNA, herein designated VGAM RNA, also designated SEQ ID:3432.

[28879] Another function of VGAM721 is therefore inhibition of V-src Sarcoma (Schmidt-Ruppin A-2) Viral Oncogene Homolog (avian) (SRC, Accession NM\_005417), a gene which is a tyrosine kinase. Accordingly, utilities of VGAM721 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SRC. The function of SRC has been established by previous studies. Elevated c-src tyrosine kinase activity has been found in colon cancers, particularly in those metastatic to the liver. Studies of the mechanism of SRC regulation suggested that SRC kinase activity is downregulated by phosphorylation of a critical C-terminal tyrosine (tyr530 in human SRC, equivalent to tyr527 in chicken Src) and have implied the existence of activating mutations in this C-terminal regulatory region. Irby et al. (1999) reported the identification of a truncating mutation in SRC at codon 531 in 12% of cases

of advanced human colon cancer tested and demonstrated that the mutation is activating, transforming, tumorigenic, and metastasis-promoting. The results provided, for the first time, genetic evidence that activating SRC mutations may have a role in the malignant progression of human colon cancer. SRC is the symbol for the human gene homologous in sequence to the v-src gene of the Rous sarcoma virus (also called avian sarcoma virus, ASV). The human protooncogene was assigned to chromosome 20 by somatic cell hybrid studies (Sakaguchi et al., 1982). Le Beau et al. (1984) assigned the SRC gene to 20q12-q13 by in situ hybridization. Lebo et al. (1984) and Parker et al. (1985) confirmed the assignment by dual-beam chromosome sorting and spot blot DNA analysis. Le Beau et al. (1985) found that deletions of 20q in myeloid disorders were actually interstitial although they appeared to be terminal; thus, the interstitial deletion had resulted in a shift at the SRC locus from 20q313 to the 20q breakpoint region. (FGR OMIM Ref. No. 164940.) Azarnia et al. (1988) found that overexpression of the SRC gene in NIH 3T3 cells caused reduction of cell-to-cell transmission of molecules in the 400- to 700-dalton range. Downregulation was enhanced by point mutation of tyrosine-527,

whereas mutation of tyrosine-416 suppressed both the downregulation of communication by the tyr-527 mutation and that by gene overexpression. The regulation of communication by SRC may be important in the control of embryonic development and cellular growth. By in situ hybridization, Morris et al. (1989) placed the SRC gene at 20q11.2. They observed a secondary peak of grains in the region 20q13.2-qter, the localization of SRC suggested by previous in situ studies. Furthermore, Morris et al. (1989) found that 1 allele of the SRC gene was lost in 2 patients with leukemia and a deletion in 20q. They suggested that the deletions were interstitial. The new assignment, 20q11.2, is consistent with the assignment of HCK (OMIM Ref. No. 142370) which presumably belongs to the same gene family, having originated from a common ancestral gene.

[28880] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[28883] Further studies establishing the function and utilities of SRC are found in John Hopkins OMIM database record ID 190090, and in cited publications numbered 9787-9791, 10883-10884, 9792, 12536, 10801-9796, 355 and 9797 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Suppressor of Fused Homolog (Drosophila) (SUFU, Accession NM\_016169) is another VGAM721 host target gene. SUFU BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SUFU, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SUFU BINDING SITE, designated SEQ ID:18254, to the nucleotide sequence of VGAM721 RNA, herein designated VGAM RNA, also designated SEQ ID:3432.

[28884] Another function of VGAM721 is therefore inhibition of Suppressor of Fused Homolog (Drosophila) (SUFU, Accession NM\_016169). Accordingly, utilities of VGAM721 in-

clude diagnosis, prevention and treatment of diseases and clinical conditions associated with SUFU. FLJ22596 (Accession NM\_025086) is another VGAM721 host target gene. FLJ22596 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ22596, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22596 BINDING SITE, designated SEQ ID:24704, to the nucleotide sequence of VGAM721 RNA, herein designated VGAM RNA, also designated SEQ ID:3432.

[28885] Another function of VGAM721 is therefore inhibition of FLJ22596 (Accession NM\_025086). Accordingly, utilities of VGAM721 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22596. KIAA0229 (Accession XM\_166478) is another VGAM721 host target gene. KIAA0229 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0229, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0229 BINDING SITE,

designated SEQ ID:44402, to the nucleotide sequence of VGAM721 RNA, herein designated VGAM RNA, also designated SEQ ID:3432.

[28886] Another function of VGAM721 is therefore inhibition of KIAA0229 (Accession XM\_166478). Accordingly, utilities of VGAM721 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0229. KIAA1228 (Accession XM\_036408) is another VGAM721 host target gene. KIAA1228 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1228, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1228 BINDING SITE, designated SEQ ID:32443, to the nucleotide sequence of VGAM721 RNA, herein designated VGAM RNA, also designated SEQ ID:3432.

[28887] Another function of VGAM721 is therefore inhibition of KIAA1228 (Accession XM\_036408). Accordingly, utilities of VGAM721 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1228. Syntaxin 6 (STX6, Accession NM\_005819) is another VGAM721 host target gene. STX6 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STX6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STX6 BINDING SITE, designated SEQ ID:12419, to the nucleotide sequence of VGAM721 RNA, herein designated VGAM RNA, also designated SEQ ID:3432.

[28888] Another function of VGAM721 is therefore inhibition of Syntaxin 6 (STX6, Accession NM\_005819). Accordingly, utilities of VGAM721 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STX6. LOC126661 (Accession XM\_059061) is another VGAM721 host target gene. LOC126661 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC126661, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126661 BINDING SITE, designated SEQ ID:36852, to the nucleotide sequence of VGAM721 RNA, herein designated VGAM RNA, also designated SEQ ID:3432.

[28889] Another function of VGAM721 is therefore inhibition of

LOC126661 (Accession XM\_059061). Accordingly, utilities of VGAM721 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126661. LOC146823 (Accession XM\_097105) is another VGAM721 host target gene. LOC146823 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146823, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146823 BINDING SITE, designated SEQ ID:40749, to the nucleotide sequence of VGAM721 RNA, herein designated VGAM RNA, also designated SEQ ID:3432.

[28890] Another function of VGAM721 is therefore inhibition of LOC146823 (Accession XM\_097105). Accordingly, utilities of VGAM721 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146823. LOC152018 (Accession XM\_098156) is another VGAM721 host target gene. LOC152018 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152018, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC152018 BINDING SITE, designated SEQ ID:41419, to the nucleotide sequence of VGAM721 RNA, herein designated VGAM RNA, also designated SEQ ID:3432.

[28891] Another function of VGAM721 is therefore inhibition of LOC152018 (Accession XM\_098156). Accordingly, utilities of VGAM721 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152018. LOC157278 (Accession XM\_098741) is another VGAM721 host target gene. LOC157278 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157278, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157278 BINDING SITE, designated SEQ ID:41776, to the nucleotide sequence of VGAM721 RNA, herein designated VGAM RNA, also designated SEQ ID:3432.

[28892] Another function of VGAM721 is therefore inhibition of LOC157278 (Accession XM\_098741). Accordingly, utilities of VGAM721 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157278. LOC219855 (Accession XM\_166184) is an-

other VGAM721 host target gene. LOC219855 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219855, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219855 BINDING SITE, designated SEQ ID:43995, to the nucleotide sequence of VGAM721 RNA, herein designated VGAM RNA, also designated SEQ ID:3432.

[28893] Another function of VGAM721 is therefore inhibition of LOC219855 (Accession XM\_166184). Accordingly, utilities of VGAM721 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219855. LOC255461 (Accession XM\_173207) is another VGAM721 host target gene. LOC255461 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255461, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255461 BINDING SITE, designated SEQ ID:46462, to the nucleotide sequence of VGAM721 RNA, herein designated VGAM RNA, also designated SEQ ID:3432.

[28894] Another function of VGAM721 is therefore inhibition of LOC255461 (Accession XM\_173207). Accordingly, utilities of VGAM721 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255461. LOC255516 (Accession XM\_173212) is another VGAM721 host target gene. LOC255516 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255516, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255516 BINDING SITE, designated SEQ ID:46468, to the nucleotide sequence of VGAM721 RNA, herein designated VGAM RNA, also designated SEQ ID:3432.

[28895] Another function of VGAM721 is therefore inhibition of LOC255516 (Accession XM\_173212). Accordingly, utilities of VGAM721 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255516. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 722 (VGAM722) viral gene, which modulates expression of respective host target genes thereof,

the function and utility of which host target genes is known in the art.

[28896] VGAM722 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM722 was detected is described hereinabove with reference to Figs. 1–8.

[28897] VGAM722 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tomato Mosaic Virus. VGAM722 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28898] VGAM722 gene encodes a VGAM722 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM722 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM722 precursor RNA is designated SEQ ID:708, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:708 is located at position 1585 relative to the genome of Tomato Mosaic Virus.

[28899] VGAM722 precursor RNA folds onto itself, forming VGAM722 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, which has a two-dimensional  
`hairpin structure`. As is well known in the art, this  
`hairpin structure`, is typical of RNA encoded by miRNA  
genes, and is due to the fact that the nucleotide sequence  
of the first half of the RNA encoded by a miRNA gene is an  
accurate or partial inversed-reversed sequence of the nu-  
cleotide sequence of the second half thereof.

[28900] An enzyme complex designated DICER COMPLEX, `dices`  
the VGAM722 folded precursor RNA into VGAM722 RNA,  
herein designated VGAM RNA, a single stranded ~22 nt  
long RNA segment. As is known in the art, `dicing` of a  
hairpin structured RNA precursor product into a short  
~22nt RNA segment is catalyzed by an enzyme complex  
comprising an enzyme called Dicer together with other  
necessary proteins. A probable (over 41%) nucleotide se-  
quence of VGAM722 RNA is designated SEQ ID:3433, and  
is provided hereinbelow with reference to the sequence  
listing part.

[28901] VGAM722 host target gene, herein designated VGAM  
HOST TARGET GENE, encodes a corresponding messenger  
RNA, VGAM722 host target RNA, herein designated VGAM  
HOST TARGET RNA. VGAM722 host target RNA comprises  
three regions, as is typical of mRNA of a protein coding

gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[28902] VGAM722 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM722 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM722 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM722 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM722 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[28903] The complementary binding of VGAM722 RNA, herein designated VGAM RNA, to host target binding sites on VGAM722 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM722 host target RNA into VGAM722 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28904] It is appreciated that VGAM722 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM722 host target genes. The mRNA of each one of this plurality of VGAM722 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM722 RNA, herein designated VGAM RNA, and which when bound by VGAM722 RNA causes inhibition of translation of respective one or more VGAM722 host target proteins.

[28905] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM722 gene, herein designated VGAM GENE, on one or more VGAM722 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[28906] It is yet further appreciated that a function of VGAM722 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM722 include diagnosis, prevention and treatment of viral infection by Tomato Mosaic Virus. Specific functions, and accordingly utilities, of VGAM722 correlate with, and may be deduced from, the identity of the host target genes which VGAM722 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[28907] Nucleotide sequences of the VGAM722 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM722 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM722 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM722 are further described hereinbelow with reference to Table 1.

[28908] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM722 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM722 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28909] As mentioned hereinabove with reference to Fig. 1, a function of VGAM722 gene, herein designated VGAM is inhibition of expression of VGAM722 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM722 correlate with, and may be deduced from, the identity of the target genes which VGAM722 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28910] Beta-site APP-cleaving Enzyme (BACE, Accession NM\_012104) is a VGAM722 host target gene. BACE BINDING SITE1 and BACE BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by BACE, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BACE BINDING SITE1 and BACE BINDING SITE2, designated SEQ ID:14413 and SEQ ID:29081 respectively, to the nucleotide sequence of VGAM722 RNA, herein designated VGAM RNA, also designated SEQ ID:3433.

[28911] A function of VGAM722 is therefore inhibition of Beta-site APP-cleaving Enzyme (BACE, Accession NM\_012104), a gene which is responsible for the proteolytic processing of the amyloid precursor protein. Accordingly, utilities of VGAM722 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BACE. The function of BACE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM173. Carbohydrate (N-acetylglucosamine 6-O) Sulfotransferase 6 (CHST6, Accession NM\_021615) is another

VGAM722 host target gene. CHST6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CHST6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHST6 BINDING SITE, designated SEQ ID:22243, to the nucleotide sequence of VGAM722 RNA, herein designated VGAM RNA, also designated SEQ ID:3433.

[28912] Another function of VGAM722 is therefore inhibition of Carbohydrate (N-acetylglucosamine 6-O) Sulfotransferase 6 (CHST6, Accession NM\_021615). Accordingly, utilities of VGAM722 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHST6. Formin 2 (FMN2, Accession XM\_086525) is another VGAM722 host target gene. FMN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FMN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FMN2 BINDING SITE, designated SEQ ID:38740, to the nucleotide sequence of VGAM722 RNA, herein designated VGAM RNA, also design-

nated SEQ ID:3433.

[28913] Another function of VGAM722 is therefore inhibition of Formin 2 (FMN2, Accession XM\_086525). Accordingly, utilities of VGAM722 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FMN2. Interleukin 20 Receptor, Alpha (IL20RA, Accession NM\_014432) is another VGAM722 host target gene. IL20RA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL20RA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL20RA BINDING SITE, designated SEQ ID:15788, to the nucleotide sequence of VGAM722 RNA, herein designated VGAM RNA, also designated SEQ ID:3433.

[28914] Another function of VGAM722 is therefore inhibition of Interleukin 20 Receptor, Alpha (IL20RA, Accession NM\_014432), a gene which is the receptor for interleukin-20. Accordingly, utilities of VGAM722 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL20RA. The function of IL20RA and its association with various diseases and clinical condi-

tions, has been established by previous studies, as described hereinabove with reference to VGAM315. Protocadherin Beta 12 (PCDHB12, Accession NM\_018932) is another VGAM722 host target gene. PCDHB12 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHB12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHB12 BINDING SITE, designated SEQ ID:21002, to the nucleotide sequence of VGAM722 RNA, herein designated VGAM RNA, also designated SEQ ID:3433.

[28915] Another function of VGAM722 is therefore inhibition of Protocadherin Beta 12 (PCDHB12, Accession NM\_018932). Accordingly, utilities of VGAM722 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHB12. Protocadherin Beta 7 (PCDHB7, Accession NM\_018940) is another VGAM722 host target gene. PCDHB7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHB7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of PCDHB7 BINDING SITE, designated SEQ ID:21007, to the nucleotide sequence of VGAM722 RNA, herein designated VGAM RNA, also designated SEQ ID:3433.

[28916] Another function of VGAM722 is therefore inhibition of Protocadherin Beta 7 (PCDHB7, Accession NM\_018940). Accordingly, utilities of VGAM722 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHB7. FLJ22167 (Accession NM\_024533) is another VGAM722 host target gene. FLJ22167 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22167, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22167 BINDING SITE, designated SEQ ID:23738, to the nucleotide sequence of VGAM722 RNA, herein designated VGAM RNA, also designated SEQ ID:3433.

[28917] Another function of VGAM722 is therefore inhibition of FLJ22167 (Accession NM\_024533). Accordingly, utilities of VGAM722 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FLJ22167. KIAA0737 (Accession NM\_014828) is another VGAM722 host target gene. KIAA0737 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0737, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0737 BINDING SITE, designated SEQ ID:16817, to the nucleotide sequence of VGAM722 RNA, herein designated VGAM RNA, also designated SEQ ID:3433.

[28918] Another function of VGAM722 is therefore inhibition of KIAA0737 (Accession NM\_014828). Accordingly, utilities of VGAM722 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0737. SE70-2 (Accession NM\_022118) is another VGAM722 host target gene. SE70-2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SE70-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SE70-2 BINDING SITE, designated SEQ ID:22662, to the nucleotide se-

quence of VGAM722 RNA, herein designated VGAM RNA, also designated SEQ ID:3433.

[28919] Another function of VGAM722 is therefore inhibition of SE70-2 (Accession NM\_022118). Accordingly, utilities of VGAM722 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SE70-2. LOC112817 (Accession NM\_138413) is another VGAM722 host target gene. LOC112817 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC112817, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC112817 BINDING SITE, designated SEQ ID:28779, to the nucleotide sequence of VGAM722 RNA, herein designated VGAM RNA, also designated SEQ ID:3433.

[28920] Another function of VGAM722 is therefore inhibition of LOC112817 (Accession NM\_138413). Accordingly, utilities of VGAM722 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC112817. LOC112840 (Accession NM\_080666) is another VGAM722 host target gene. LOC112840 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC112840, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC112840 BINDING SITE, designated SEQ ID:27954, to the nucleotide sequence of VGAM722 RNA, herein designated VGAM RNA, also designated SEQ ID:3433.

[28921] Another function of VGAM722 is therefore inhibition of LOC112840 (Accession NM\_080666). Accordingly, utilities of VGAM722 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC112840. LOC158332 (Accession XM\_088554) is another VGAM722 host target gene. LOC158332 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158332, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158332 BINDING SITE, designated SEQ ID:39822, to the nucleotide sequence of VGAM722 RNA, herein designated VGAM RNA, also designated SEQ ID:3433.

[28922] Another function of VGAM722 is therefore inhibition of LOC158332 (Accession XM\_088554). Accordingly, utilities

of VGAM722 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158332. LOC254549 (Accession XM\_171404) is another VGAM722 host target gene. LOC254549 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254549, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254549 BINDING SITE, designated SEQ ID:46045, to the nucleotide sequence of VGAM722 RNA, herein designated VGAM RNA, also designated SEQ ID:3433.

[28923] Another function of VGAM722 is therefore inhibition of LOC254549 (Accession XM\_171404). Accordingly, utilities of VGAM722 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254549. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 723 (VGAM723) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28924] VGAM723 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM723 was detected is described hereinabove with reference to Figs. 1–8.

[28925] VGAM723 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tomato Mosaic Virus. VGAM723 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28926] VGAM723 gene encodes a VGAM723 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM723 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM723 precursor RNA is designated SEQ ID:709, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:709 is located at position 2545 relative to the genome of Tomato Mosaic Virus.

[28927] VGAM723 precursor RNA folds onto itself, forming VGAM723 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this

`hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28928] An enzyme complex designated DICER COMPLEX, `dices` the VGAM723 folded precursor RNA into VGAM723 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM723 RNA is designated SEQ ID:3434, and is provided hereinbelow with reference to the sequence listing part.

[28929] VGAM723 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM723 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM723 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN

CODING and 3`UTR respectively.

[28930] VGAM723 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM723 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM723 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM723 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM723 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[28931] The complementary binding of VGAM723 RNA, herein designated VGAM RNA, to host target binding sites on VGAM723 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM723 host target RNA into VGAM723 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28932] It is appreciated that VGAM723 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM723 host target genes. The mRNA of each one of this plurality of VGAM723 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM723 RNA, herein designated VGAM RNA, and which when bound by VGAM723 RNA causes inhibition of translation of respective one or more VGAM723 host target proteins.

[28933] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM723 gene, herein designated VGAM GENE, on one or more VGAM723 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[28934] It is yet further appreciated that a function of VGAM723 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM723 include diagnosis, prevention and treatment of viral infection by Tomato Mosaic Virus. Specific functions, and accordingly utilities, of VGAM723 correlate with, and may be deduced from, the identity of the host target genes which VGAM723 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28935] Nucleotide sequences of the VGAM723 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the  
`diced` VGAM723 RNA, herein designated VGAM RNA,  
and a schematic representation of the secondary folding  
of VGAM723 folded precursor RNA, herein designated  
VGAM FOLDED PRECURSOR RNA, of VGAM723 are further  
described hereinbelow with reference to Table 1.

[28936] Nucleotide sequences of host target binding sites, such as  
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of  
Fig. 1, found on VGAM723 host target RNA, and schematic  
representation of the complementarity of each of these  
host target binding sites to VGAM723 RNA, herein desig-  
nated VGAM RNA, are described hereinbelow with refer-  
ence to Table 2.

[28937] As mentioned hereinabove with reference to Fig. 1, a  
function of VGAM723 gene, herein designated VGAM is  
inhibition of expression of VGAM723 target genes. It is  
appreciated that specific functions, and accordingly utili-  
ties, of VGAM723 correlate with, and may be deduced  
from, the identity of the target genes which VGAM723  
binds and inhibits, and the function of these target genes,  
as elaborated hereinbelow.

[28938] Aldolase A, Fructose-bisphosphate (ALDOA, Accession  
NM\_000034) is a VGAM723 host target gene. ALDOA

BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ALDOA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALDOA BINDING SITE, designated SEQ ID:5473, to the nucleotide sequence of VGAM723 RNA, herein designated VGAM RNA, also designated SEQ ID:3434.

[28939] A function of VGAM723 is therefore inhibition of Aldolase A, Fructose-bisphosphate (ALDOA, Accession NM\_000034). Accordingly, utilities of VGAM723 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALDOA. Keratocan (KERA, Accession NM\_007035) is another VGAM723 host target gene. KERA BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KERA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KERA BINDING SITE, designated SEQ ID:13906, to the nucleotide sequence of VGAM723 RNA, herein designated VGAM RNA, also designated SEQ ID:3434.

[28940] Another function of VGAM723 is therefore inhibition of

Keratocan (KERA, Accession NM\_007035), a gene which may be important in developing and maintaining corneal transparency and for the structure of the stromal matrix. Accordingly, utilities of VGAM723 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KERA. The function of KERA has been established by previous studies. Keratan sulfate proteoglycans (KSPGs) are members of the small leucine-rich proteoglycan (SLRP) family. KSPGs, particularly keratocan, lumican (OMIM Ref. No. 600616), and mimecan (OMIM Ref. No. 602383), are important to the transparency of the cornea. Liu et al. (1998) isolated mouse keratocan cDNA and genomic DNA. Mouse keratocan cDNA predicts a 351-amino acid polypeptide containing a conserved central leucine-rich repeat region. Northern blot analysis of mouse tissues revealed that keratocan is expressed selectively in the eye throughout development. In situ hybridization demonstrated that keratocan is expressed early in neural crest development and later in corneal stromal cells. Tasheva et al. (1999) isolated the cDNA and identified the genomic structure of the human keratocan gene. The gene is spread over 7.65 kb of DNA and contains 3 exons. An open reading frame starting at the be-

gining of the second exon encodes a protein of 352 amino acids. The amino acid sequence of keratocan shows high identity among mammalian species. This evolutionary conservation between the keratocan proteins as well as the restricted expression of the KERA gene in cornea suggests that this molecule might be important in developing and maintaining corneal transparency.

[28941] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[28942] Liu, C.-Y.; Shiraishi, A.; Kao, C. W.-C.; Converse, R. L.; Funderburgh, J. L.; Corpuz, L. M.; Conrad, G. W.; Kao, W. W.-Y. : The cloning of mouse keratocan cDNA and genomic DNA and the characterization of its expression during eye development. J. Biol. Chem. 273: 22584-22588, 1998. ; and

[28943] Tasheva, E. S.; Funderburgh, J. L.; Funderburgh, M. L.; Corpuz, L. M.; Conrad, G. W. : Structure and sequence of the gene encoding human keratocan. DNA Seq. 10: 67-74, 1999.

[28944] Further studies establishing the function and utilities of KERA are found in John Hopkins OMIM database record ID 603288, and in cited publications numbered 5339,

10027, 359 and 5341–5342 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Phospholipase A2, Group IID (PLA2G2D, Accession NM\_012400) is another VGAM723 host target gene. PLA2G2D BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PLA2G2D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLA2G2D BINDING SITE, designated SEQ ID:14775, to the nucleotide sequence of VGAM723 RNA, herein designated VGAM RNA, also designated SEQ ID:3434.

[28945] Another function of VGAM723 is therefore inhibition of Phospholipase A2, Group IID (PLA2G2D, Accession NM\_012400), a gene which is involved in phospholipid digestion, remodeling of cell membranes, and host defense, as well as pathophysiologic processes. Accordingly, utilities of VGAM723 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLA2G2D. The function of PLA2G2D and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove

with reference to VGAM74.Podocalyxin-like (PODXL, Accession NM\_005397) is another VGAM723 host target gene. PODXL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PODXL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PODXL BINDING SITE, designated SEQ ID:11870, to the nucleotide sequence of VGAM723 RNA, herein designated VGAM RNA, also designated SEQ ID:3434.

[28946] Another function of VGAM723 is therefore inhibition of Podocalyxin-like (PODXL, Accession NM\_005397), a gene which is an antiadhesin. Accordingly, utilities of VGAM723 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PODXL. The function of PODXL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM247.Adaptor-related Protein Complex 3, Sigma 2 Subunit (AP3S2, Accession NM\_005829) is another VGAM723 host target gene. AP3S2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region

of mRNA encoded by AP3S2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AP3S2 BINDING SITE, designated SEQ ID:12439, to the nucleotide sequence of VGAM723 RNA, herein designated VGAM RNA, also designated SEQ ID:3434.

[28947] Another function of VGAM723 is therefore inhibition of Adaptor-related Protein Complex 3, Sigma 2 Subunit (AP3S2, Accession NM\_005829). Accordingly, utilities of VGAM723 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP3S2. Phytanoyl-CoA Hydroxylase Interacting Protein (PHYHIP, Accession NM\_014759) is another VGAM723 host target gene. PHYHIP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PHYHIP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PHYHIP BINDING SITE, designated SEQ ID:16509, to the nucleotide sequence of VGAM723 RNA, herein designated VGAM RNA, also designated SEQ ID:3434.

[28948] Another function of VGAM723 is therefore inhibition of Phytanoyl-CoA Hydroxylase Interacting Protein (PHYHIP, Accession NM\_014759). Accordingly, utilities of VGAM723 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PHYHIP.

LOC136183 (Accession XM\_069753) is another VGAM723 host target gene. LOC136183 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC136183, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC136183 BINDING SITE, designated SEQ ID:37391, to the nucleotide sequence of VGAM723 RNA, herein designated VGAM RNA, also designated SEQ ID:3434.

[28949] Another function of VGAM723 is therefore inhibition of LOC136183 (Accession XM\_069753). Accordingly, utilities of VGAM723 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC136183. LOC150819 (Accession XM\_097954) is another VGAM723 host target gene. LOC150819 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150819, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150819 BINDING SITE, designated SEQ ID:41245, to the nucleotide sequence of VGAM723 RNA, herein designated VGAM RNA, also designated SEQ ID:3434.

[28950] Another function of VGAM723 is therefore inhibition of LOC150819 (Accession XM\_097954). Accordingly, utilities of VGAM723 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150819. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 724 (VGAM724) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28951] VGAM724 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM724 was detected is described hereinabove with reference to Figs. 1–8.

[28952] VGAM724 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tomato Mosaic Virus.

VGAM724 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28953] VGAM724 gene encodes a VGAM724 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM724 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM724 precursor RNA is designated SEQ ID:710, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:710 is located at position 3312 relative to the genome of Tomato Mosaic Virus.

[28954] VGAM724 precursor RNA folds onto itself, forming VGAM724 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28955] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM724 folded precursor RNA into VGAM724 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM724 RNA is designated SEQ ID:3435, and is provided hereinbelow with reference to the sequence listing part.

[28956] VGAM724 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM724 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM724 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[28957] VGAM724 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM724 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM724 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM724 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM724 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[28958] The complementary binding of VGAM724 RNA, herein designated VGAM RNA, to host target binding sites on VGAM724 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM724 host target RNA into VGAM724 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28959] It is appreciated that VGAM724 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM724 host target genes. The mRNA of each one of this plurality of VGAM724 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM724 RNA, herein designated VGAM RNA, and which when bound by VGAM724 RNA causes inhibition of translation of respective one or more VGAM724 host target proteins.

[28960] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM724 gene, herein designated VGAM GENE, on one or more VGAM724 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[28961] It is yet further appreciated that a function of VGAM724 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM724 include diagnosis, prevention and treatment of viral infection by Tomato Mosaic Virus. Specific functions, and accordingly utilities, of VGAM724 correlate with, and may be deduced from, the identity of the host target genes which VGAM724 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28962] Nucleotide sequences of the VGAM724 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM724 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM724 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM724 are further described hereinbelow with reference to Table 1.

[28963] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM724 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM724 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28964] As mentioned hereinabove with reference to Fig. 1, a function of VGAM724 gene, herein designated VGAM is inhibition of expression of VGAM724 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM724 correlate with, and may be deduced from, the identity of the target genes which VGAM724 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28965] Amyloid Beta Precursor Protein (cytoplasmic tail) Binding Protein 2 (APPBP2, Accession NM\_006380) is a VGAM724 host target gene. APPBP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by APPBP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APPBP2 BINDING SITE, des-

ignated SEQ ID:13078, to the nucleotide sequence of VGAM724 RNA, herein designated VGAM RNA, also designated SEQ ID:3435.

[28966] A function of VGAM724 is therefore inhibition of Amyloid Beta Precursor Protein (cytoplasmic tail) Binding Protein 2 (APPBP2, Accession NM\_006380), a gene which interacts with the basolateral sorting signal of amyloid precursor protein. Accordingly, utilities of VGAM724 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APPBP2. The function of APPBP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM525.BTB and CNC Homology 1, Basic Leucine Zipper Transcription Factor 1 (BACH1, Accession NM\_001186) is another VGAM724 host target gene. BACH1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BACH1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BACH1 BINDING SITE, designated SEQ ID:6853, to the nucleotide sequence of VGAM724 RNA, herein designated VGAM RNA, also design-

nated SEQ ID:3435.

[28967] Another function of VGAM724 is therefore inhibition of BTB and CNC Homology 1, Basic Leucine Zipper Transcription Factor 1 (BACH1, Accession NM\_001186), a gene which acts as repressor or activator, binds to nf-e2 binding sites. Accordingly, utilities of VGAM724 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BACH1. The function of BACH1 has been established by previous studies. Members of the small Maf family are basic region leucine zipper (bZip) proteins that can function as transcriptional activators or repressors (see OMIM Ref. No. MAFG, 602020). Small Maf proteins can switch from transcriptional repressors to activators, depending on the proteins with which they form heterodimers. Using a yeast 2 hybrid screen to identify MafK (OMIM Ref. No. 600197) heterodimerization partners, Oyake et al. (1996) identified mouse cDNAs encoding Bach1 and Bach2. Both Bach proteins contained a BTB (broad complex-tramtrack-bric-a-brac) or POZ (poxvirus and zinc finger) protein interaction domain and a CNC (Cap'n'collar)-type bZip domain. Oyake et al. (1996) demonstrated that Bach1 and Bach2 (OMIM Ref. No. 605394) form heterodimers with MafK, and function as

transcriptional activators or repressors when expressed in mammalian cells. Therefore, the authors suggested that the Bach proteins play important roles in coordinating transcription activation and repression by MafK. While developing a physical map of chromosome 21, both Ohira et al. (1998) and Blouin et al. (1998) isolated cDNAs encoding human BACH1. Ohira et al. (1998) reported that the sequence of the predicted 736-amino acid human protein is 80% identical to that of mouse Bach1. Human BACH1, like mouse Bach1, contains a BTB domain and CNC bZip domain. Northern analysis revealed that BACH1 is expressed ubiquitously as a 5.5-kb mRNA. An additional strong 3-kb signal was seen in testis.

[28968] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[28969] Ohira, M.; Seki, N.; Nagase, T.; Ishikawa, K.; Nomura, N.; Ohara, O. : Characterization of a human homolog (BACH1) of the mouse Bach1 gene encoding a BTB-basic leucine zipper transcription factor and its mapping to chromosome 21q22.1. *Genomics* 47: 300-306, 1998. ; and

[28970] Oyake, T.; Itoh, K.; Motohashi 1. Blouin, J.-L.; Sail, G. D.; Guipponi, M.; Rossier, C.; Pappasavas, M.-P.; Antonarakis,

S. E. : Isolation of the human BACH1 transcription regulator gene.

[28971] Further studies establishing the function and utilities of BACH1 are found in John Hopkins OMIM database record ID 602751, and in cited publications numbered 2414, 586 and 5881–5882 listed in the bibliography section herein–below, which are also hereby incorporated by reference. LOC145371 (Accession XM\_085123) is another VGAM724 host target gene. LOC145371 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC145371, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145371 BINDING SITE, designated SEQ ID:37839, to the nucleotide sequence of VGAM724 RNA, herein designated VGAM RNA, also designated SEQ ID:3435.

[28972] Another function of VGAM724 is therefore inhibition of LOC145371 (Accession XM\_085123). Accordingly, utilities of VGAM724 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145371. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 725 (VGAM725) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[28973] VGAM725 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM725 was detected is described hereinabove with reference to Figs. 1–8.

[28974] VGAM725 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tomato Mosaic Virus. VGAM725 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[28975] VGAM725 gene encodes a VGAM725 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM725 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM725 precursor RNA is designated SEQ ID:711, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:711 is located at position 4413 relative to the genome of Tomato

## Mosaic Virus.

[28976] VGAM725 precursor RNA folds onto itself, forming VGAM725 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[28977] An enzyme complex designated DICER COMPLEX, `dices` the VGAM725 folded precursor RNA into VGAM725 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM725 RNA is designated SEQ ID:3436, and is provided hereinbelow with reference to the sequence listing part.

[28978] VGAM725 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM725 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM725 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[28979] VGAM725 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM725 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM725 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM725 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM725 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[28980] The complementary binding of VGAM725 RNA, herein designated VGAM RNA, to host target binding sites on VGAM725 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM725 host target RNA into VGAM725 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[28981] It is appreciated that VGAM725 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM725 host target genes. The mRNA of each one of this plurality of VGAM725 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM725 RNA, herein designated VGAM RNA, and which when bound by VGAM725 RNA causes inhibition of translation of respective one or more VGAM725 host target proteins.

[28982] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM725 gene, herein designated VGAM GENE, on one or more VGAM725 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[28983] It is yet further appreciated that a function of VGAM725 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM725 include diagnosis, prevention and treatment of viral infection by Tomato Mosaic Virus. Specific functions, and accordingly utilities, of VGAM725 cor-

relate with, and may be deduced from, the identity of the host target genes which VGAM725 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[28984] Nucleotide sequences of the VGAM725 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM725 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM725 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM725 are further described hereinbelow with reference to Table 1.

[28985] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM725 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM725 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[28986] As mentioned hereinabove with reference to Fig. 1, a function of VGAM725 gene, herein designated VGAM is inhibition of expression of VGAM725 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM725 correlate with, and may be deduced

from, the identity of the target genes which VGAM725 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[28987] Amyloid Beta (A4) Precursor Protein-binding, Family A, Member 1 (X11) (APBA1, Accession XM\_046018) is a VGAM725 host target gene. APBA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by APBA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APBA1 BINDING SITE, designated SEQ ID:34648, to the nucleotide sequence of VGAM725 RNA, herein designated VGAM RNA, also designated SEQ ID:3436.

[28988] A function of VGAM725 is therefore inhibition of Amyloid Beta (A4) Precursor Protein-binding, Family A, Member 1 (X11) (APBA1, Accession XM\_046018), a gene which stabilises APP and inhibits production of proteolytic APP fragments. Accordingly, utilities of VGAM725 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APBA1. The function of APBA1 and its association with various diseases and clinical conditions, has been established by previous studies, as de-

scribed hereinabove with reference to VGAM247. Histone Deacetylase 5 (HDAC5, Accession NM\_139205) is another VGAM725 host target gene. HDAC5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HDAC5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HDAC5 BINDING SITE, designated SEQ ID:29222, to the nucleotide sequence of VGAM725 RNA, herein designated VGAM RNA, also designated SEQ ID:3436.

[28989] Another function of VGAM725 is therefore inhibition of Histone Deacetylase 5 (HDAC5, Accession NM\_139205), a gene which is responsible for the deacetylation of lysine residues on the n-terminal part of the core histones and mediate transcriptional regulation. Accordingly, utilities of VGAM725 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HDAC5. The function of HDAC5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM263. Potassium Voltage-gated Channel, Shal-related Subfamily, Member 2 (KCND2, Accession

NM\_012281) is another VGAM725 host target gene. KCND2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KCND2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCND2 BINDING SITE, designated SEQ ID:14608, to the nucleotide sequence of VGAM725 RNA, herein designated VGAM RNA, also designated SEQ ID:3436.

[28990] Another function of VGAM725 is therefore inhibition of Potassium Voltage-gated Channel, Shal-related Subfamily, Member 2 (KCND2, Accession NM\_012281), a gene which is prominent in the repolarization phase of the action potential. Accordingly, utilities of VGAM725 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCND2. The function of KCND2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM449. N-myc Downstream Regulated Gene 1 (NDRG1, Accession XM\_005243) is another VGAM725 host target gene. NDRG1 BINDING SITE is HOST TARGET binding site found

in the 3` untranslated region of mRNA encoded by NDRG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NDRG1 BINDING SITE, designated SEQ ID:29966, to the nucleotide sequence of VGAM725 RNA, herein designated VGAM RNA, also designated SEQ ID:3436.

[28991] Another function of VGAM725 is therefore inhibition of N-myc Downstream Regulated Gene 1 (NDRG1, Accession XM\_005243), a gene which may have a growth inhibitory role. Accordingly, utilities of VGAM725 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NDRG1. The function of NDRG1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM144.KIAA1297 (Accession XM\_051005) is another VGAM725 host target gene. KIAA1297 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1297, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1297 BINDING SITE, designated SEQ ID:35710, to the nucleotide sequence of VGAM725 RNA, herein designated VGAM RNA, also designated SEQ ID:3436.

[28992] Another function of VGAM725 is therefore inhibition of KIAA1297 (Accession XM\_051005). Accordingly, utilities of VGAM725 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1297. Opiate Receptor-like 1 (OPRL1, Accession NM\_000913) is another VGAM725 host target gene. OPRL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OPRL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OPRL1 BINDING SITE, designated SEQ ID:6615, to the nucleotide sequence of VGAM725 RNA, herein designated VGAM RNA, also designated SEQ ID:3436.

[28993] Another function of VGAM725 is therefore inhibition of Opiate Receptor-like 1 (OPRL1, Accession NM\_000913). Accordingly, utilities of VGAM725 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OPRL1. Protein Phosphatase 2 (formerly

2A), Regulatory Subunit B", Alpha (PPP2R3A, Accession NM\_002718) is another VGAM725 host target gene. PPP2R3A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PPP2R3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP2R3A BINDING SITE, designated SEQ ID:8584, to the nucleotide sequence of VGAM725 RNA, herein designated VGAM RNA, also designated SEQ ID:3436.

[28994] Another function of VGAM725 is therefore inhibition of Protein Phosphatase 2 (formerly 2A), Regulatory Subunit B", Alpha (PPP2R3A, Accession NM\_002718). Accordingly, utilities of VGAM725 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP2R3A. RA-GEF-2 (Accession NM\_016340) is another VGAM725 host target gene. RA-GEF-2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RA-GEF-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RA-

GEF-2 BINDING SITE, designated SEQ ID:18464, to the nucleotide sequence of VGAM725 RNA, herein designated VGAM RNA, also designated SEQ ID:3436.

[28995] Another function of VGAM725 is therefore inhibition of RA-GEF-2 (Accession NM\_016340). Accordingly, utilities of VGAM725 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RA-GEF-2. LOC126961 (Accession XM\_059101) is another VGAM725 host target gene. LOC126961 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC126961, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126961 BINDING SITE, designated SEQ ID:36886, to the nucleotide sequence of VGAM725 RNA, herein designated VGAM RNA, also designated SEQ ID:3436.

[28996] Another function of VGAM725 is therefore inhibition of LOC126961 (Accession XM\_059101). Accordingly, utilities of VGAM725 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126961. LOC201696 (Accession XM\_032269) is another VGAM725 host target gene. LOC201696 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201696, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201696 BINDING SITE, designated SEQ ID:31627, to the nucleotide sequence of VGAM725 RNA, herein designated VGAM RNA, also designated SEQ ID:3436.

[28997] Another function of VGAM725 is therefore inhibition of LOC201696 (Accession XM\_032269). Accordingly, utilities of VGAM725 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201696. LOC255042 (Accession XM\_170896) is another VGAM725 host target gene. LOC255042 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255042, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255042 BINDING SITE, designated SEQ ID:45648, to the nucleotide sequence of VGAM725 RNA, herein designated VGAM RNA, also designated SEQ ID:3436.

[28998] Another function of VGAM725 is therefore inhibition of

LOC255042 (Accession XM\_170896). Accordingly, utilities of VGAM725 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255042. LOC257395 (Accession XM\_170919) is another VGAM725 host target gene. LOC257395 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257395, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257395 BINDING SITE, designated SEQ ID:45694, to the nucleotide sequence of VGAM725 RNA, herein designated VGAM RNA, also designated SEQ ID:3436.

[28999] Another function of VGAM725 is therefore inhibition of LOC257395 (Accession XM\_170919). Accordingly, utilities of VGAM725 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257395. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 726 (VGAM726) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is

known in the art.

[29000] VGAM726 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM726 was detected is described hereinabove with reference to Figs. 1–8.

[29001] VGAM726 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tomato Mosaic Virus. VGAM726 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29002] VGAM726 gene encodes a VGAM726 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM726 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM726 precursor RNA is designated SEQ ID:712, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:712 is located at position 3315 relative to the genome of Tomato Mosaic Virus.

[29003] VGAM726 precursor RNA folds onto itself, forming VGAM726 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional

`hairpin structure`. As is well known in the art, this  
`hairpin structure`, is typical of RNA encoded by miRNA  
genes, and is due to the fact that the nucleotide sequence  
of the first half of the RNA encoded by a miRNA gene is an  
accurate or partial inversed-reversed sequence of the nu-  
cleotide sequence of the second half thereof.

[29004] An enzyme complex designated DICER COMPLEX, `dices`  
the VGAM726 folded precursor RNA into VGAM726 RNA,  
herein designated VGAM RNA, a single stranded ~22 nt  
long RNA segment. As is known in the art, `dicing` of a  
hairpin structured RNA precursor product into a short  
~22nt RNA segment is catalyzed by an enzyme complex  
comprising an enzyme called Dicer together with other  
necessary proteins. A probable (over 40%) nucleotide se-  
quence of VGAM726 RNA is designated SEQ ID:3437, and  
is provided hereinbelow with reference to the sequence  
listing part.

[29005] VGAM726 host target gene, herein designated VGAM  
HOST TARGET GENE, encodes a corresponding messenger  
RNA, VGAM726 host target RNA, herein designated VGAM  
HOST TARGET RNA. VGAM726 host target RNA comprises  
three regions, as is typical of mRNA of a protein coding  
gene: a 5` untranslated region, a protein coding region

and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[29006] VGAM726 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM726 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM726 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM726 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM726 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[29007] The complementary binding of VGAM726 RNA, herein designated VGAM RNA, to host target binding sites on VGAM726 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM726 host target RNA into VGAM726 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29008] It is appreciated that VGAM726 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM726 host target genes. The mRNA of each one of this plurality of VGAM726 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM726 RNA, herein designated VGAM RNA, and which when bound by VGAM726 RNA causes inhibition of translation of respective one or more VGAM726 host target proteins.

[29009] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM726 gene, herein designated VGAM GENE, on one or

more VGAM726 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[29010] It is yet further appreciated that a function of VGAM726 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM726 include diagnosis, prevention and treatment of viral infection by Tomato Mosaic Virus. Specific functions, and accordingly utilities, of VGAM726 correlate with, and may be deduced from, the identity of the host target genes which VGAM726 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [29011] Nucleotide sequences of the VGAM726 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM726 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM726 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM726 are further described hereinbelow with reference to Table 1.
- [29012] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM726 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM726 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [29013] As mentioned hereinabove with reference to Fig. 1, a function of VGAM726 gene, herein designated VGAM is inhibition of expression of VGAM726 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM726 correlate with, and may be deduced from, the identity of the target genes which VGAM726 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.
- [29014] BTB and CNC Homology 1, Basic Leucine Zipper Transcrip-

tion Factor 1 (BACH1, Accession NM\_001186) is a VGAM726 host target gene. BACH1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BACH1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BACH1 BINDING SITE, designated SEQ ID:6854, to the nucleotide sequence of VGAM726 RNA, herein designated VGAM RNA, also designated SEQ ID:3437.

[29015] A function of VGAM726 is therefore inhibition of BTB and CNC Homology 1, Basic Leucine Zipper Transcription Factor 1 (BACH1, Accession NM\_001186), a gene which acts as repressor or activator, binds to nf- $\kappa$ B binding sites. Accordingly, utilities of VGAM726 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BACH1. The function of BACH1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM724. Solute Carrier Family 4, Sodium Bicarbonate Cotransporter, Member 4 (SLC4A4, Accession NM\_003759) is another VGAM726 host target gene. SLC4A4 BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by SLC4A4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC4A4 BINDING SITE, designated SEQ ID:9834, to the nucleotide sequence of VGAM726 RNA, herein designated VGAM RNA, also designated SEQ ID:3437.

[29016] Another function of VGAM726 is therefore inhibition of Solute Carrier Family 4, Sodium Bicarbonate Cotransporter, Member 4 (SLC4A4, Accession NM\_003759), a gene which is a sodium bicarbonate cotransporter. Accordingly, utilities of VGAM726 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC4A4. The function of SLC4A4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM222.UC28 (Accession NM\_021635) is another VGAM726 host target gene. UC28 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UC28, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of UC28 BINDING SITE, designated SEQ ID:22278, to the nucleotide sequence of VGAM726 RNA, herein designated VGAM RNA, also designated SEQ ID:3437.

[29017] Another function of VGAM726 is therefore inhibition of UC28 (Accession NM\_021635). Accordingly, utilities of VGAM726 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UC28. FLJ10933 (Accession NM\_018278) is another VGAM726 host target gene. FLJ10933 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10933, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10933 BINDING SITE, designated SEQ ID:20267, to the nucleotide sequence of VGAM726 RNA, herein designated VGAM RNA, also designated SEQ ID:3437.

[29018] Another function of VGAM726 is therefore inhibition of FLJ10933 (Accession NM\_018278). Accordingly, utilities of VGAM726 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10933. FLJ13659 (Accession NM\_025189) is another VGAM726

host target gene. FLJ13659 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13659, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13659 BINDING SITE, designated SEQ ID:24831, to the nucleotide sequence of VGAM726 RNA, herein designated VGAM RNA, also designated SEQ ID:3437.

[29019] Another function of VGAM726 is therefore inhibition of FLJ13659 (Accession NM\_025189). Accordingly, utilities of VGAM726 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13659. KIAA1321 (Accession XM\_030856) is another VGAM726 host target gene. KIAA1321 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1321, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1321 BINDING SITE, designated SEQ ID:31191, to the nucleotide sequence of VGAM726 RNA, herein designated VGAM RNA, also designated SEQ ID:3437.

[29020] Another function of VGAM726 is therefore inhibition of KIAA1321 (Accession XM\_030856). Accordingly, utilities of VGAM726 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1321. LOC145371 (Accession XM\_085123) is another VGAM726 host target gene. LOC145371 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145371, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145371 BINDING SITE, designated SEQ ID:37840, to the nucleotide sequence of VGAM726 RNA, herein designated VGAM RNA, also designated SEQ ID:3437.

[29021] Another function of VGAM726 is therefore inhibition of LOC145371 (Accession XM\_085123). Accordingly, utilities of VGAM726 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145371. LOC90288 (Accession XM\_030669) is another VGAM726 host target gene. LOC90288 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90288, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90288 BINDING SITE, designated SEQ ID:31103, to the nucleotide sequence of VGAM726 RNA, herein designated VGAM RNA, also designated SEQ ID:3437.

[29022] Another function of VGAM726 is therefore inhibition of LOC90288 (Accession XM\_030669). Accordingly, utilities of VGAM726 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90288. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 727 (VGAM727) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29023] VGAM727 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM727 was detected is described hereinabove with reference to Figs. 1–8.

[29024] VGAM727 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Aconitum Latent Virus. VGAM727 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[29025] VGAM727 gene encodes a VGAM727 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM727 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM727 precursor RNA is designated SEQ ID:713, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:713 is located at position 3494 relative to the genome of Aconitum Latent Virus.

[29026] VGAM727 precursor RNA folds onto itself, forming VGAM727 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29027] An enzyme complex designated DICER COMPLEX, `dices` the VGAM727 folded precursor RNA into VGAM727 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 90%) nucleotide sequence of VGAM727 RNA is designated SEQ ID:3438, and is provided hereinbelow with reference to the sequence listing part.

[29028] VGAM727 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM727 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM727 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[29029] VGAM727 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM727 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM727 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM727 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM727 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[29030] The complementary binding of VGAM727 RNA, herein designated VGAM RNA, to host target binding sites on VGAM727 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM727 host target RNA into VGAM727 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[29031] It is appreciated that VGAM727 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM727 host target genes. The mRNA of each one of this plurality of VGAM727 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM727 RNA, herein designated VGAM RNA, and which when bound by VGAM727 RNA causes inhibition of translation of respective one or more VGAM727 host target proteins.

[29032] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM727 gene, herein designated VGAM GENE, on one or more VGAM727 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[29033] It is yet further appreciated that a function of VGAM727 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM727 include diagnosis, prevention and treatment of viral infection by Aconitum Latent Virus. Specific functions, and accordingly utilities, of VGAM727 correlate with, and may be deduced from, the identity of the host target genes which VGAM727 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29034] Nucleotide sequences of the VGAM727 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM727 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM727 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM727 are further described hereinbelow with reference to Table 1.

[29035] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM727 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM727 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29036] As mentioned hereinabove with reference to Fig. 1, a function of VGAM727 gene, herein designated VGAM is inhibition of expression of VGAM727 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM727 correlate with, and may be deduced from, the identity of the target genes which VGAM727 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29037] A Disintegrin and Metalloproteinase Domain 19 (meltrin beta) (ADAM19, Accession NM\_033274) is a VGAM727 host target gene. ADAM19 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADAM19, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAM19 BINDING SITE, designated SEQ ID:27098, to the nucleotide sequence of

VGAM727 RNA, herein designated VGAM RNA, also designated SEQ ID:3438.

[29038] A function of VGAM727 is therefore inhibition of A Disintegrin and Metalloproteinase Domain 19 (meltrin beta) (ADAM19, Accession NM\_033274), a gene which participates in the proteolytic processing of beta-type neuregulin isoforms . Accordingly, utilities of VGAM727 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAM19. The function of ADAM19 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM179. Potassium Voltage-gated Channel, Shaker-related Subfamily, Beta Member 1 (KCNAB1, Accession XM\_027634) is another VGAM727 host target gene. KCNAB1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KCNAB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNAB1 BINDING SITE, designated SEQ ID:30547, to the nucleotide sequence of VGAM727 RNA, herein designated VGAM RNA, also designated SEQ

ID:3438.

[29039] Another function of VGAM727 is therefore inhibition of Potassium Voltage-gated Channel, Shaker-related Subfamily, Beta Member 1 (KCNAB1, Accession XM\_027634), a gene which is the regulatory beta subunit for a shaker-related voltage-gated potassium channel. Accordingly, utilities of VGAM727 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNAB1. The function of KCNAB1 has been established by previous studies. 'Shaker' and other voltage-dependent potassium channel proteins help to determine the electrical properties of excitable cells and play additional physiologic roles in nonexcitable cell types. Voltage-activated, outwardly rectifying potassium channels (Kv) are heterooligomers that are assembled from alpha and beta subunits in a 1:1 molar ratio. Schultz et al. (1996) noted that mammals contain a large number of alpha-subunit potassium channel genes, often clustered within the genome, that may have arisen through local and chromosomal duplication events. The associated beta subunits modulate the gating properties and amplitudes of the Shaker potassium currents. England et al. (1995) cloned a human heart cDNA encoding a beta subunit that

they designated Kv-beta-1.3. Sequence analysis revealed that Kv-beta-1.3 and the previously identified human Kv-beta-1 (England et al., 1995) and Kv-beta-3 (McCormack et al., 1995) subunits differ only at their N termini and are encoded by alternatively spliced mRNAs from a single gene. The authors suggested that Kv-beta-1 and Kv-beta-3 be renamed Kv-beta-1.1 and Kv-beta-1.2, respectively. The predicted 419-amino acid Kv-beta-1.3 subunit does not contain a hydrophobic domain and is likely to be a cytoplasmic protein, like other beta subunits. When coexpressed in *Xenopus* oocytes, the Kv-beta-1.3 subunit altered the functional properties of Kv1.5 (KCNA5; 176267), converting it from a delayed rectifier to a channel with rapid but partial inactivation. In addition, Kv-beta-1.3 converted the Kv1.5 outwardly rectifying current-voltage relationship to one showing strong inward rectification. England et al. (1995) concluded that Kv channel current diversity may arise from association with alternatively spliced Kv-beta subunits. By Northern blot analysis, Leicher et al. (1996) found that the KCNA1B gene was expressed as 3.4- and 3.8-kb mRNAs in human brain. The pattern of expression of Kv1-alpha and Kv-beta subunits suggested an intricate and cell-specific reg-

ulatory mechanism that produces distinct combinations of alpha and beta subunits in different nuclei of the brain.

The Kv-beta-1.1 and Kv-beta-1.2 splice variants contain an N-terminal inactivating domain similar to that found in A-type Kv channels (see OMIM Ref. No. KCNA4; 176266).

When coexpressed in mammalian cells, Kv-beta-1.1 and Kv-beta-1.2 conferred rapid inactivation on Kv1.5 channels, with different potencies

[29040] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[29041] Leicher, T. Roeper, J.; Weber, K.; Wang, X.; Pongs, O. : Structural and functional characterization of human potassium channel subunit beta-1 (KCNA1B). *Neuropharmacology* 35: 787-795, 1996. ; and

[29042] Schultz, D.; Litt, M.; Smith, L.; Thayer, M.; McCormack, K. : Localization of two potassium channel beta subunit genes, KCNA1B and KCNA2B. *Genomics* 31: 389-391, 1996.

[29043] Further studies establishing the function and utilities of KCNAB1 are found in John Hopkins OMIM database record ID 601141, and in cited publications numbered 6841-2849 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Polycystic

Kidney Disease (polycystin) and REJ (sperm receptor for egg jelly homolog, sea urchin)-like (PKDREJ, Accession NM\_006071) is another VGAM727 host target gene.

PKDREJ BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PKDREJ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PKDREJ BINDING SITE, designated SEQ ID:12715, to the nucleotide sequence of VGAM727 RNA, herein designated VGAM RNA, also designated SEQ ID:3438.

[29044] Another function of VGAM727 is therefore inhibition of Polycystic Kidney Disease (polycystin) and REJ (sperm receptor for egg jelly homolog, sea urchin)-like (PKDREJ, Accession NM\_006071), a gene which may intervene in fertilization. Accordingly, utilities of VGAM727 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PKDREJ. The function of PKDREJ and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM641. RAD54B (Accession NM\_134434) is another VGAM727 host target

gene. RAD54B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAD54B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAD54B BINDING SITE, designated SEQ ID:28676, to the nucleotide sequence of VGAM727 RNA, herein designated VGAM RNA, also designated SEQ ID:3438.

[29045] Another function of VGAM727 is therefore inhibition of RAD54B (Accession NM\_134434), a gene which is involved in dna repair and mitotic recombination. Accordingly, utilities of VGAM727 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAD54B. The function of RAD54B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM595. Sorting Nexin 10 (SNX10, Accession NM\_013322) is another VGAM727 host target gene. SNX10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SNX10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of SNX10 BINDING SITE, designated SEQ ID:14967, to the nucleotide sequence of VGAM727 RNA, herein designated VGAM RNA, also designated SEQ ID:3438.

[29046] Another function of VGAM727 is therefore inhibition of Sorting Nexin 10 (SNX10, Accession NM\_013322). Accordingly, utilities of VGAM727 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNX10. LOC115294 (Accession XM\_054302) is another VGAM727 host target gene. LOC115294 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC115294, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115294 BINDING SITE, designated SEQ ID:36148, to the nucleotide sequence of VGAM727 RNA, herein designated VGAM RNA, also designated SEQ ID:3438.

[29047] Another function of VGAM727 is therefore inhibition of LOC115294 (Accession XM\_054302). Accordingly, utilities of VGAM727 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC115294. LOC148254 (Accession XM\_086121) is another VGAM727 host target gene. LOC148254 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148254, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148254 BINDING SITE, designated SEQ ID:38503, to the nucleotide sequence of VGAM727 RNA, herein designated VGAM RNA, also designated SEQ ID:3438.

[29048] Another function of VGAM727 is therefore inhibition of LOC148254 (Accession XM\_086121). Accordingly, utilities of VGAM727 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148254. LOC164714 (Accession XM\_104657) is another VGAM727 host target gene. LOC164714 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC164714, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC164714 BINDING SITE, designated SEQ ID:42181, to the nucleotide sequence of VGAM727 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3438.

[29049] Another function of VGAM727 is therefore inhibition of LOC164714 (Accession XM\_104657). Accordingly, utilities of VGAM727 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC164714. LOC166424 (Accession XM\_105867) is another VGAM727 host target gene. LOC166424 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC166424, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC166424 BINDING SITE, designated SEQ ID:42195, to the nucleotide sequence of VGAM727 RNA, herein designated VGAM RNA, also designated SEQ ID:3438.

[29050] Another function of VGAM727 is therefore inhibition of LOC166424 (Accession XM\_105867). Accordingly, utilities of VGAM727 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC166424. LOC255096 (Accession XM\_174913) is another VGAM727 host target gene. LOC255096 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255096, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255096 BINDING SITE, designated SEQ ID:46608, to the nucleotide sequence of VGAM727 RNA, herein designated VGAM RNA, also designated SEQ ID:3438.

[29051] Another function of VGAM727 is therefore inhibition of LOC255096 (Accession XM\_174913). Accordingly, utilities of VGAM727 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255096. LOC91380 (Accession XM\_038134) is another VGAM727 host target gene. LOC91380 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91380, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91380 BINDING SITE, designated SEQ ID:32756, to the nucleotide sequence of VGAM727 RNA, herein designated VGAM RNA, also designated SEQ ID:3438.

[29052] Another function of VGAM727 is therefore inhibition of LOC91380 (Accession XM\_038134). Accordingly, utilities of VGAM727 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC91380. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 728 (VGAM728) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29053] VGAM728 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM728 was detected is described hereinabove with reference to Figs. 1–8.

[29054] VGAM728 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Aconitum Latent Virus. VGAM728 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29055] VGAM728 gene encodes a VGAM728 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM728 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM728 precursor RNA is designated SEQ

ID:714, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:714 is located at position 3248 relative to the genome of Aconitum Latent Virus.

[29056] VGAM728 precursor RNA folds onto itself, forming VGAM728 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29057] An enzyme complex designated DICER COMPLEX, `dices` the VGAM728 folded precursor RNA into VGAM728 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM728 RNA is designated SEQ ID:3439, and is provided hereinbelow with reference to the sequence

listing part.

[29058] VGAM728 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM728 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM728 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[29059] VGAM728 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM728 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM728 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM728 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM728 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[29060] The complementary binding of VGAM728 RNA, herein designated VGAM RNA, to host target binding sites on VGAM728 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM728 host target RNA into VGAM728 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29061] It is appreciated that VGAM728 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM728 host target genes. The mRNA of each one of this plurality of VGAM728 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM728 RNA, herein designated VGAM

RNA, and which when bound by VGAM728 RNA causes inhibition of translation of respective one or more VGAM728 host target proteins.

[29062] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM728 gene, herein designated VGAM GENE, on one or more VGAM728 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[29063] It is yet further appreciated that a function of VGAM728 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM728 include diagnosis, prevention and treatment of viral infection by Aconitum Latent Virus. Specific functions, and accordingly utilities, of VGAM728 correlate with, and may be deduced from, the identity of the host target genes which VGAM728 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29064] Nucleotide sequences of the VGAM728 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM728 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM728 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM728 are further described hereinbelow with reference to Table 1.

[29065] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM728 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM728 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29066] As mentioned hereinabove with reference to Fig. 1, a function of VGAM728 gene, herein designated VGAM is

inhibition of expression of VGAM728 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM728 correlate with, and may be deduced from, the identity of the target genes which VGAM728 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29067] B-cell CLL/lymphoma 11B (zinc finger protein) (BCL11B, Accession NM\_022898) is a VGAM728 host target gene. BCL11B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BCL11B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL11B BINDING SITE, designated SEQ ID:23159, to the nucleotide sequence of VGAM728 RNA, herein designated VGAM RNA, also designated SEQ ID:3439.

[29068] A function of VGAM728 is therefore inhibition of B-cell CLL/lymphoma 11B (zinc finger protein) (BCL11B, Accession NM\_022898). Accordingly, utilities of VGAM728 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL11B. Chromosome 20 Open Reading Frame 64 (C20orf64, Accession

NM\_033550) is another VGAM728 host target gene. C20orf64 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by C20orf64, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf64 BINDING SITE, designated SEQ ID:27310, to the nucleotide sequence of VGAM728 RNA, herein designated VGAM RNA, also designated SEQ ID:3439.

[29069] Another function of VGAM728 is therefore inhibition of Chromosome 20 Open Reading Frame 64 (C20orf64, Accession NM\_033550). Accordingly, utilities of VGAM728 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf64. KIAA1958 (Accession XM\_088566) is another VGAM728 host target gene. KIAA1958 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1958, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1958 BINDING SITE, designated SEQ ID:39827, to the nucleotide sequence of

VGAM728 RNA, herein designated VGAM RNA, also designated SEQ ID:3439.

[29070] Another function of VGAM728 is therefore inhibition of KIAA1958 (Accession XM\_088566). Accordingly, utilities of VGAM728 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1958. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 729 (VGAM729) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29071] VGAM729 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM729 was detected is described hereinabove with reference to Figs. 1–8.

[29072] VGAM729 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cydia Pomonella Granulovirus. VGAM729 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29073] VGAM729 gene encodes a VGAM729 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM729 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM729 precursor RNA is designated SEQ ID:715, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:715 is located at position 72517 relative to the genome of Cydia Pomonella Granulovirus.

[29074] VGAM729 precursor RNA folds onto itself, forming VGAM729 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29075] An enzyme complex designated DICER COMPLEX, `dices` the VGAM729 folded precursor RNA into VGAM729 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM729 RNA is designated SEQ ID:3440, and is provided hereinbelow with reference to the sequence listing part.

[29076] VGAM729 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM729 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM729 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[29077] VGAM729 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM729 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM729 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM729 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM729 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[29078] The complementary binding of VGAM729 RNA, herein designated VGAM RNA, to host target binding sites on VGAM729 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM729 host target RNA into VGAM729 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29079] It is appreciated that VGAM729 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM729 host target genes. The mRNA of each one of this plurality of VGAM729 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM729 RNA, herein designated VGAM RNA, and which when bound by VGAM729 RNA causes inhibition of translation of respective one or more VGAM729 host target proteins.

[29080] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM729 gene, herein designated VGAM GENE, on one or more VGAM729 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[29081] It is yet further appreciated that a function of VGAM729 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM729 include diagnosis, prevention and treatment of viral infection by Cydia Pomonella Granulovirus. Specific functions, and accordingly utilities, of VGAM729 correlate with, and may be deduced from, the identity of the host target genes which VGAM729 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29082] Nucleotide sequences of the VGAM729 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM729 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM729 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM729 are further described hereinbelow with reference to Table 1.

[29083] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM729 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM729 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29084] As mentioned hereinabove with reference to Fig. 1, a function of VGAM729 gene, herein designated VGAM is inhibition of expression of VGAM729 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM729 correlate with, and may be deduced from, the identity of the target genes which VGAM729 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29085] FLJ10716 (Accession NM\_018191) is a VGAM729 host target gene. FLJ10716 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10716, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10716 BINDING SITE, designated SEQ ID:20046, to the nucleotide sequence of VGAM729 RNA, herein designated VGAM RNA, also designated SEQ ID:3440.

[29086] A function of VGAM729 is therefore inhibition of FLJ10716 (Accession NM\_018191). Accordingly, utilities of

VGAM729 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10716. NTT73 (Accession NM\_018057) is another VGAM729 host target gene. NTT73 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NTT73, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NTT73 BINDING SITE, designated SEQ ID:19822, to the nucleotide sequence of VGAM729 RNA, herein designated VGAM RNA, also designated SEQ ID:3440.

[29087] Another function of VGAM729 is therefore inhibition of NTT73 (Accession NM\_018057). Accordingly, utilities of VGAM729 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NTT73. LOC157562 (Accession XM\_098779) is another VGAM729 host target gene. LOC157562 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC157562, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157562 BINDING

SITE, designated SEQ ID:41818, to the nucleotide sequence of VGAM729 RNA, herein designated VGAM RNA, also designated SEQ ID:3440.

[29088] Another function of VGAM729 is therefore inhibition of LOC157562 (Accession XM\_098779). Accordingly, utilities of VGAM729 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157562. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 730 (VGAM730) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29089] VGAM730 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM730 was detected is described hereinabove with reference to Figs. 1–8.

[29090] VGAM730 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cydia Pomonella Granulovirus. VGAM730 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29091] VGAM730 gene encodes a VGAM730 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM730 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM730 precursor RNA is designated SEQ ID:716, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:716 is located at position 72933 relative to the genome of Cydia Pomonella Granulovirus.

[29092] VGAM730 precursor RNA folds onto itself, forming VGAM730 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29093] An enzyme complex designated DICER COMPLEX, `dices` the VGAM730 folded precursor RNA into VGAM730 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of VGAM730 RNA is designated SEQ ID:3441, and is provided hereinbelow with reference to the sequence listing part.

[29094] VGAM730 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM730 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM730 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[29095] VGAM730 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM730 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM730 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM730 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM730 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[29096] The complementary binding of VGAM730 RNA, herein designated VGAM RNA, to host target binding sites on VGAM730 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM730 host target RNA into VGAM730 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29097] It is appreciated that VGAM730 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM730 host target genes. The mRNA of each one of this plurality of VGAM730 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM730 RNA, herein designated VGAM RNA, and which when bound by VGAM730 RNA causes inhibition of translation of respective one or more VGAM730 host target proteins.

[29098] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM730 gene, herein designated VGAM GENE, on one or more VGAM730 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,  
`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[29099] It is yet further appreciated that a function of VGAM730 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM730 include diagnosis, prevention and treatment of viral infection by Cydia Pomonella Granulovirus. Specific functions, and accordingly utilities, of VGAM730 correlate with, and may be deduced from, the identity of the host target genes which VGAM730 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29100] Nucleotide sequences of the VGAM730 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM730 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM730 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM730 are further described hereinbelow with reference to Table 1.

[29101] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM730 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM730 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29102] As mentioned hereinabove with reference to Fig. 1, a function of VGAM730 gene, herein designated VGAM is inhibition of expression of VGAM730 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM730 correlate with, and may be deduced from, the identity of the target genes which VGAM730 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29103] ATP-binding Cassette, Sub-family D (ALD), Member 1 (ABCD1, Accession NM\_000033) is a VGAM730 host target gene. ABCD1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ABCD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCD1 BINDING SITE, designated SEQ ID:5470, to the nucleotide sequence of VGAM730 RNA, herein designated VGAM RNA, also designated SEQ ID:3441.

[29104] A function of VGAM730 is therefore inhibition of ATP-binding Cassette, Sub-family D (ALD), Member 1 (ABCD1, Accession NM\_000033). Accordingly, utilities of VGAM730 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCD1. Chromosome 14 Open Reading Frame 1 (C14orf1, Accession NM\_007176) is another VGAM730 host target gene. C14orf1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C14orf1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C14orf1 BINDING SITE, designated SEQ ID:14027, to the nucleotide sequence of VGAM730 RNA, herein designated VGAM RNA, also designated SEQ ID:3441.

[29105] Another function of VGAM730 is therefore inhibition of Chromosome 14 Open Reading Frame 1 (C14orf1, Accession NM\_007176). Accordingly, utilities of VGAM730 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C14orf1. Dead Ringer-like 1 (Drosophila) (DRIL1, Accession NM\_005224) is another VGAM730 host target gene. DRIL1 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DRIL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DRIL1 BINDING SITE, designated SEQ ID:11718, to the nucleotide sequence of VGAM730 RNA, herein designated VGAM RNA, also designated SEQ ID:3441.

[29106] Another function of VGAM730 is therefore inhibition of Dead Ringer-like 1 (Drosophila) (DRIL1, Accession NM\_005224), a gene which binds a  $\mu$  promoter proximal site necessary for induced  $\mu$ -heavy-chain transcription. Accordingly, utilities of VGAM730 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DRIL1. The function of DRIL1 has been established by previous studies. Herrscher et al. (1995) identified the mouse Bright (B-cell regulator of IgH transcription) gene. They found that the Bright protein is expressed specifically in B cells and transactivates an IgH enhancer in transient transfection assays. Bright and the Drosophila 'dead ringer' (dri) gene product belong to a protein family whose members share a conserved DNA-binding domain termed the 'A/T-rich interaction domain'

(ARID). By PCR using degenerate primers based on the ARID sequence, Kortschak et al. (1998) isolated a HeLa cell cDNA encoding DRIL1. Overall, the predicted protein is 79% identical to mouse Bright. The DNA-binding domain of DRIL1 is highly conserved, sharing 97% and 79% identity with the DNA-binding domain of Bright and DRI, respectively. Northern and dot blot analyses revealed that DRIL1 was expressed as a 4.4-kb mRNA in all tissues tested. The DRIL1 gene contains 8 exons. Kortschak et al. (1998) mapped the DRIL1 gene to 19p13.3 by fluorescence in situ hybridization and by analysis of cosmids from this region.

[29107] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[29108] Herrscher, R. F.; Kaplan, M. H.; Lelsz, D. L.; Das, C.; Scheuermann, R.; Tucker, P. W. : The immunoglobulin heavy-chain matrix-associating regions are bound by Bright: a B cell-specific trans-activator that describes a new DNA-binding protein family. *Genes Dev.* 9: 3067-3082, 1995. ; and

[29109] Kortschak, R. D.; Reimann, H.; Zimmer, M.; Eyre, H. J.; Saint, R.; Jenne, D. E. : The human dead ringer/bright ho-

molog, DRIL1: cDNA cloning, gene structure, and mapping to D19S886, a ma.

[29110] Further studies establishing the function and utilities of DRIL1 are found in John Hopkins OMIM database record ID 603265, and in cited publications numbered 6329–6330 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Isoprenylcysteine Carboxyl Methyltransferase (ICMT, Accession NM\_012405) is another VGAM730 host target gene. ICMT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ICMT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ICMT BINDING SITE, designated SEQ ID:14780, to the nucleotide sequence of VGAM730 RNA, herein designated VGAM RNA, also designated SEQ ID:3441.

[29111] Another function of VGAM730 is therefore inhibition of Isoprenylcysteine Carboxyl Methyltransferase (ICMT, Accession NM\_012405). Accordingly, utilities of VGAM730 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ICMT. Ubiquitin-conjugating Enzyme E2L 3 (UBE2L3, Accession

NM\_003347) is another VGAM730 host target gene. UBE2L3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by UBE2L3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBE2L3 BINDING SITE, designated SEQ ID:9356, to the nucleotide sequence of VGAM730 RNA, herein designated VGAM RNA, also designated SEQ ID:3441.

[29112] Another function of VGAM730 is therefore inhibition of Ubiquitin-conjugating Enzyme E2L 3 (UBE2L3, Accession NM\_003347), a gene which catalyzes the covalent attachment of ubiquitin to other proteins. Accordingly, utilities of VGAM730 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE2L3. The function of UBE2L3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM215.KIAA0329 (Accession NM\_014844) is another VGAM730 host target gene. KIAA0329 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0329, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0329 BINDING SITE, designated SEQ ID:16872, to the nucleotide sequence of VGAM730 RNA, herein designated VGAM RNA, also designated SEQ ID:3441.

[29113] Another function of VGAM730 is therefore inhibition of KIAA0329 (Accession NM\_014844). Accordingly, utilities of VGAM730 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0329. KIAA1554 (Accession XM\_170834) is another VGAM730 host target gene. KIAA1554 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1554, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1554 BINDING SITE, designated SEQ ID:45607, to the nucleotide sequence of VGAM730 RNA, herein designated VGAM RNA, also designated SEQ ID:3441.

[29114] Another function of VGAM730 is therefore inhibition of KIAA1554 (Accession XM\_170834). Accordingly, utilities of VGAM730 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA1554. PR Domain Containing 7 (PRDM7, Accession NM\_052996) is another VGAM730 host target gene. PRDM7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRDM7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRDM7 BINDING SITE, designated SEQ ID:27566, to the nucleotide sequence of VGAM730 RNA, herein designated VGAM RNA, also designated SEQ ID:3441.

[29115] Another function of VGAM730 is therefore inhibition of PR Domain Containing 7 (PRDM7, Accession NM\_052996). Accordingly, utilities of VGAM730 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRDM7. PR Domain Containing 9 (PRDM9, Accession NM\_020227) is another VGAM730 host target gene. PRDM9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRDM9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of PRDM9 BINDING SITE, designated SEQ ID:21493, to the nucleotide sequence of VGAM730 RNA, herein designated VGAM RNA, also designated SEQ ID:3441.

[29116] Another function of VGAM730 is therefore inhibition of PR Domain Containing 9 (PRDM9, Accession NM\_020227). Accordingly, utilities of VGAM730 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRDM9. RAB40C, Member RAS Oncogene Family (RAB40C, Accession NM\_021168) is another VGAM730 host target gene. RAB40C BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB40C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB40C BINDING SITE, designated SEQ ID:22144, to the nucleotide sequence of VGAM730 RNA, herein designated VGAM RNA, also designated SEQ ID:3441.

[29117] Another function of VGAM730 is therefore inhibition of RAB40C, Member RAS Oncogene Family (RAB40C, Accession NM\_021168). Accordingly, utilities of VGAM730 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with RAB40C. SEC8 (Accession NM\_021807) is another VGAM730 host target gene. SEC8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEC8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEC8 BINDING SITE, designated SEQ ID:22359, to the nucleotide sequence of VGAM730 RNA, herein designated VGAM RNA, also designated SEQ ID:3441.

[29118] Another function of VGAM730 is therefore inhibition of SEC8 (Accession NM\_021807). Accordingly, utilities of VGAM730 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEC8. Transmembrane Protease, Serine 5 (spinesin) (TMPRSS5, Accession NM\_030770) is another VGAM730 host target gene. TMPRSS5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TMPRSS5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TMPRSS5 BINDING SITE, designated SEQ ID:25054, to the nucleotide sequence of VGAM730 RNA,

herein designated VGAM RNA, also designated SEQ ID:3441.

[29119] Another function of VGAM730 is therefore inhibition of Transmembrane Protease, Serine 5 (spinesin) (TMPRSS5, Accession NM\_030770). Accordingly, utilities of VGAM730 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TMPRSS5.

LOC149319 (Accession XM\_086495) is another VGAM730 host target gene. LOC149319 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149319, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149319 BINDING SITE, designated SEQ ID:38712, to the nucleotide sequence of VGAM730 RNA, herein designated VGAM RNA, also designated SEQ ID:3441.

[29120] Another function of VGAM730 is therefore inhibition of LOC149319 (Accession XM\_086495). Accordingly, utilities of VGAM730 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149319. LOC254423 (Accession XM\_173286) is another VGAM730 host target gene. LOC254423 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC254423, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254423 BINDING SITE, designated SEQ ID:46528, to the nucleotide sequence of VGAM730 RNA, herein designated VGAM RNA, also designated SEQ ID:3441.

[29121] Another function of VGAM730 is therefore inhibition of LOC254423 (Accession XM\_173286). Accordingly, utilities of VGAM730 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254423. LOC89919 (Accession XM\_027244) is another VGAM730 host target gene. LOC89919 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC89919, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC89919 BINDING SITE, designated SEQ ID:30461, to the nucleotide sequence of VGAM730 RNA, herein designated VGAM RNA, also designated SEQ ID:3441.

[29122] Another function of VGAM730 is therefore inhibition of

LOC89919 (Accession XM\_027244). Accordingly, utilities of VGAM730 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC89919. LOC91812 (Accession XM\_040857) is another VGAM730 host target gene. LOC91812 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC91812, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91812 BINDING SITE, designated SEQ ID:33389, to the nucleotide sequence of VGAM730 RNA, herein designated VGAM RNA, also designated SEQ ID:3441.

[29123] Another function of VGAM730 is therefore inhibition of LOC91812 (Accession XM\_040857). Accordingly, utilities of VGAM730 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91812. LOC91813 (Accession XM\_040862) is another VGAM730 host target gene. LOC91813 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC91813, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC91813 BINDING SITE, designated SEQ ID:33393, to the nucleotide sequence of VGAM730 RNA, herein designated VGAM RNA, also designated SEQ ID:3441.

[29124] Another function of VGAM730 is therefore inhibition of LOC91813 (Accession XM\_040862). Accordingly, utilities of VGAM730 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91813. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 731 (VGAM731) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29125] VGAM731 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM731 was detected is described hereinabove with reference to Figs. 1–8.

[29126] VGAM731 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cydia Pomonella Granulovirus. VGAM731 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in

the human genome.

[29127] VGAM731 gene encodes a VGAM731 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM731 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM731 precursor RNA is designated SEQ ID:717, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:717 is located at position 71312 relative to the genome of Cydia Pomonella Granulovirus.

[29128] VGAM731 precursor RNA folds onto itself, forming VGAM731 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29129] An enzyme complex designated DICER COMPLEX, `dices` the VGAM731 folded precursor RNA into VGAM731 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM731 RNA is designated SEQ ID:3442, and is provided hereinbelow with reference to the sequence listing part.

[29130] VGAM731 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM731 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM731 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[29131] VGAM731 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM731 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM731 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM731 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM731 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[29132] The complementary binding of VGAM731 RNA, herein designated VGAM RNA, to host target binding sites on VGAM731 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM731 host target RNA into VGAM731 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29133] It is appreciated that VGAM731 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM731 host target genes. The mRNA of each one of this plurality of VGAM731 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM731 RNA, herein designated VGAM RNA, and which when bound by VGAM731 RNA causes inhibition of translation of respective one or more VGAM731 host target proteins.

[29134] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM731 gene, herein designated VGAM GENE, on one or more VGAM731 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[29135] It is yet further appreciated that a function of VGAM731 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM731 include diagnosis, prevention and treatment of viral infection by Cydia Pomonella Granulovirus. Specific functions, and accordingly utilities, of VGAM731 correlate with, and may be deduced from, the identity of the host target genes which VGAM731 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29136] Nucleotide sequences of the VGAM731 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM731 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM731 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM731 are further described hereinbelow with reference to Table 1.

[29137] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM731 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM731 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29138] As mentioned hereinabove with reference to Fig. 1, a function of VGAM731 gene, herein designated VGAM is inhibition of expression of VGAM731 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM731 correlate with, and may be deduced from, the identity of the target genes which VGAM731 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29139] Component of Oligomeric Golgi Complex 7 (COG7, Accession XM\_041725) is a VGAM731 host target gene. COG7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by COG7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COG7 BINDING SITE, designated SEQ ID:33577, to the nucleotide sequence of VGAM731 RNA, herein designated VGAM RNA, also designated SEQ ID:3442.

[29140] A function of VGAM731 is therefore inhibition of Component of Oligomeric Golgi Complex 7 (COG7, Accession XM\_041725). Accordingly, utilities of VGAM731 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COG7. FLJ13710 (Accession NM\_024817) is another VGAM731 host target gene. FLJ13710 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13710, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13710 BINDING SITE, designated SEQ ID:24208, to the nucleotide sequence of VGAM731 RNA, herein designated VGAM RNA, also designated SEQ ID:3442.

[29141] Another function of VGAM731 is therefore inhibition of FLJ13710 (Accession NM\_024817). Accordingly, utilities of VGAM731 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13710. KIAA1486 (Accession XM\_041126) is another VGAM731 host target gene. KIAA1486 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1486, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1486 BINDING SITE, designated SEQ ID:33461, to the nucleotide sequence of VGAM731 RNA, herein designated VGAM RNA, also designated SEQ ID:3442.

[29142] Another function of VGAM731 is therefore inhibition of KIAA1486 (Accession XM\_041126). Accordingly, utilities of VGAM731 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1486. KIAA1954 (Accession XM\_085375) is another VGAM731 host target gene. KIAA1954 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1954, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1954 BINDING SITE, designated SEQ ID:38095, to the nucleotide sequence of VGAM731 RNA, herein designated VGAM RNA, also designated SEQ ID:3442.

[29143] Another function of VGAM731 is therefore inhibition of KIAA1954 (Accession XM\_085375). Accordingly, utilities of VGAM731 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA1954. MGC2541 (Accession NM\_080670) is another VGAM731 host target gene. MGC2541 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC2541, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2541 BINDING SITE, designated SEQ ID:27962, to the nucleotide sequence of VGAM731 RNA, herein designated VGAM RNA, also designated SEQ ID:3442.

[29144] Another function of VGAM731 is therefore inhibition of MGC2541 (Accession NM\_080670). Accordingly, utilities of VGAM731 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2541. Septin 3 (SEPT3, Accession NM\_019106) is another VGAM731 host target gene. SEPT3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEPT3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEPT3 BINDING SITE, designated SEQ ID:21180, to the nucleotide se-

quence of VGAM731 RNA, herein designated VGAM RNA, also designated SEQ ID:3442.

[29145] Another function of VGAM731 is therefore inhibition of Septin 3 (SEPT3, Accession NM\_019106). Accordingly, utilities of VGAM731 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEPT3. LOC146958 (Accession XM\_097142) is another VGAM731 host target gene. LOC146958 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146958, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146958 BINDING SITE, designated SEQ ID:40775, to the nucleotide sequence of VGAM731 RNA, herein designated VGAM RNA, also designated SEQ ID:3442.

[29146] Another function of VGAM731 is therefore inhibition of LOC146958 (Accession XM\_097142). Accordingly, utilities of VGAM731 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146958. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 732 (VGAM732) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29147] VGAM732 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM732 was detected is described hereinabove with reference to Figs. 1–8.

[29148] VGAM732 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cydia Pomonella Granulovirus. VGAM732 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29149] VGAM732 gene encodes a VGAM732 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM732 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM732 precursor RNA is designated SEQ ID:718, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:718 is located at position 73500 relative to the genome of Cydia Pomonella Granulovirus.

[29150] VGAM732 precursor RNA folds onto itself, forming VGAM732 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29151] An enzyme complex designated DICER COMPLEX, `dices` the VGAM732 folded precursor RNA into VGAM732 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM732 RNA is designated SEQ ID:3443, and is provided hereinbelow with reference to the sequence listing part.

[29152] VGAM732 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM732 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM732 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[29153] VGAM732 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM732 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM732 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM732 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM732 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[29154] The complementary binding of VGAM732 RNA, herein designated VGAM RNA, to host target binding sites on VGAM732 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM732 host target RNA into VGAM732 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29155] It is appreciated that VGAM732 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM732 host target genes. The mRNA of each one of this plurality of VGAM732 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM732 RNA, herein designated VGAM RNA, and which when bound by VGAM732 RNA causes inhibition of translation of respective one or more VGAM732 host target proteins.

[29156] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM732 gene, herein designated VGAM GENE, on one or more VGAM732 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[29157] It is yet further appreciated that a function of VGAM732 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM732 include diagnosis, prevention and treatment of viral infection by Cydia Pomonella Granulovirus. Specific functions, and accordingly utilities, of VGAM732 correlate with, and may be deduced from, the

identity of the host target genes which VGAM732 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29158] Nucleotide sequences of the VGAM732 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM732 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM732 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM732 are further described hereinbelow with reference to Table 1.

[29159] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM732 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM732 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29160] As mentioned hereinabove with reference to Fig. 1, a function of VGAM732 gene, herein designated VGAM is inhibition of expression of VGAM732 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM732 correlate with, and may be deduced from, the identity of the target genes which VGAM732

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29161] RP42 (Accession NM\_020640) is a VGAM732 host target gene. RP42 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RP42, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RP42 BINDING SITE, designated SEQ ID:21800, to the nucleotide sequence of VGAM732 RNA, herein designated VGAM RNA, also designated SEQ ID:3443.

[29162] A function of VGAM732 is therefore inhibition of RP42 (Accession NM\_020640), a gene which not clear yet. Accordingly, utilities of VGAM732 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RP42. The function of RP42 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM47. Retinoschisis (X-linked, juvenile) 1 (RS1, Accession NM\_000330) is another VGAM732 host target gene. RS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RS1, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RS1 BINDING SITE, designated SEQ ID:5876, to the nucleotide sequence of VGAM732 RNA, herein designated VGAM RNA, also designated SEQ ID:3443.

[29163] Another function of VGAM732 is therefore inhibition of Retinoschisis (X-linked, juvenile) 1 (RS1, Accession NM\_000330). Accordingly, utilities of VGAM732 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RS1. FLJ22940 (Accession NM\_024571) is another VGAM732 host target gene. FLJ22940 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ22940, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22940 BINDING SITE, designated SEQ ID:23797, to the nucleotide sequence of VGAM732 RNA, herein designated VGAM RNA, also designated SEQ ID:3443.

[29164] Another function of VGAM732 is therefore inhibition of FLJ22940 (Accession NM\_024571). Accordingly, utilities of

VGAM732 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22940. Mal, T-cell Differentiation Protein 2 (MAL2, Accession NM\_052886) is another VGAM732 host target gene. MAL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAL2 BINDING SITE, designated SEQ ID:27468, to the nucleotide sequence of VGAM732 RNA, herein designated VGAM RNA, also designated SEQ ID:3443.

[29165] Another function of VGAM732 is therefore inhibition of Mal, T-cell Differentiation Protein 2 (MAL2, Accession NM\_052886). Accordingly, utilities of VGAM732 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAL2. TU3A (Accession NM\_007177) is another VGAM732 host target gene. TU3A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TU3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

TU3A BINDING SITE, designated SEQ ID:14032, to the nucleotide sequence of VGAM732 RNA, herein designated VGAM RNA, also designated SEQ ID:3443.

[29166] Another function of VGAM732 is therefore inhibition of TU3A (Accession NM\_007177). Accordingly, utilities of VGAM732 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TU3A. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 733 (VGAM733) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29167] VGAM733 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM733 was detected is described hereinabove with reference to Figs. 1–8.

[29168] VGAM733 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Barley Yellow Mosaic Virus. VGAM733 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29169] VGAM733 gene encodes a VGAM733 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM733 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM733 precursor RNA is designated SEQ ID:719, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:719 is located at position 6830 relative to the genome of Barley Yellow Mosaic Virus.

[29170] VGAM733 precursor RNA folds onto itself, forming VGAM733 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29171] An enzyme complex designated DICER COMPLEX, `dices` the VGAM733 folded precursor RNA into VGAM733 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of VGAM733 RNA is designated SEQ ID:3444, and is provided hereinbelow with reference to the sequence listing part.

[29172] VGAM733 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM733 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM733 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[29173] VGAM733 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM733 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM733 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM733 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM733 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[29174] The complementary binding of VGAM733 RNA, herein designated VGAM RNA, to host target binding sites on VGAM733 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM733 host target RNA into VGAM733 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29175] It is appreciated that VGAM733 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM733 host target genes. The mRNA of each one of this plurality of VGAM733 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM733 RNA, herein designated VGAM RNA, and which when bound by VGAM733 RNA causes inhibition of translation of respective one or more VGAM733 host target proteins.

[29176] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM733 gene, herein designated VGAM GENE, on one or more VGAM733 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[29177] It is yet further appreciated that a function of VGAM733 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM733 include diagnosis, prevention and treatment of viral infection by Barley Yellow Mosaic Virus. Specific functions, and accordingly utilities, of VGAM733 correlate with, and may be deduced from, the identity of the host target genes which VGAM733 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29178] Nucleotide sequences of the VGAM733 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM733 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM733 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM733 are further described hereinbelow with reference to Table 1.

[29179] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM733 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM733 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29180] As mentioned hereinabove with reference to Fig. 1, a function of VGAM733 gene, herein designated VGAM is inhibition of expression of VGAM733 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM733 correlate with, and may be deduced from, the identity of the target genes which VGAM733 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29181] ATP-binding Cassette, Sub-family C (CFTR/MRP), Member 3 (ABCC3, Accession NM\_020038) is a VGAM733 host target gene. ABCC3 BINDING SITE1 and ABCC3 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ABCC3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCC3 BINDING SITE1 and ABCC3 BINDING SITE2, designated SEQ ID:21290 and SEQ ID:21289 respectively, to the nucleotide sequence of VGAM733 RNA, herein designated VGAM RNA, also designated SEQ ID:3444.

[29182] A function of VGAM733 is therefore inhibition of ATP-binding Cassette, Sub-family C (CFTR/MRP), Member 3 (ABCC3, Accession NM\_020038), a gene which may act as an inducible transporter in the biliary and intestinal excretion of organic anions. Accordingly, utilities of VGAM733 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCC3. The function of ABCC3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM505. Parkinson Disease (autosomal recessive, juvenile) 2, Parkin (PARK2, Accession NM\_004562) is another VGAM733 host target gene. PARK2 BINDING SITE1 through PARK2 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PARK2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PARK2 BINDING SITE1 through PARK2 BINDING SITE3, designated SEQ ID:10905, SEQ ID:15152 and SEQ ID:15159 respectively, to the nucleotide sequence of VGAM733 RNA, herein designated VGAM RNA, also designated SEQ ID:3444.

[29183] Another function of VGAM733 is therefore inhibition of Parkinson Disease (autosomal recessive, juvenile) 2, Parkin (PARK2, Accession NM\_004562). Accordingly, utilities of VGAM733 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PARK2. Olfactomedin 3 (OLFM3, Accession XM\_088951) is another VGAM733 host target gene. OLFM3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OLFM3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OLFM3 BINDING SITE, designated SEQ ID:39961, to the nucleotide sequence of VGAM733 RNA, herein designated VGAM RNA, also designated SEQ ID:3444.

[29184] Another function of VGAM733 is therefore inhibition of Olfactomedin 3 (OLFM3, Accession XM\_088951). Accordingly, utilities of VGAM733 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OLFM3. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 734 (VGAM734) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29185] VGAM734 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM734 was detected is described hereinabove with reference to Figs. 1–8.

[29186] VGAM734 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Barley Yellow Mosaic Virus. VGAM734 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29187] VGAM734 gene encodes a VGAM734 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM734 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM734 precursor RNA is designated SEQ ID:720, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:720 is located at position 4284 relative to the genome of Barley Yellow Mosaic Virus.

[29188] VGAM734 precursor RNA folds onto itself, forming

VGAM734 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29189] An enzyme complex designated DICER COMPLEX, `dices` the VGAM734 folded precursor RNA into VGAM734 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM734 RNA is designated SEQ ID:3445, and is provided hereinbelow with reference to the sequence listing part.

[29190] VGAM734 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM734 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM734 host target RNA comprises

three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[29191] VGAM734 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM734 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM734 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM734 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM734 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[29192] The complementary binding of VGAM734 RNA, herein designated VGAM RNA, to host target binding sites on VGAM734 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM734 host target RNA into VGAM734 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29193] It is appreciated that VGAM734 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM734 host target genes. The mRNA of each one of this plurality of VGAM734 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM734 RNA, herein designated VGAM RNA, and which when bound by VGAM734 RNA causes inhibition of translation of respective one or more VGAM734 host target proteins.

[29194] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM734 gene, herein designated VGAM GENE, on one or more VGAM734 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[29195] It is yet further appreciated that a function of VGAM734 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM734 include diagnosis, prevention and treatment of viral infection by Barley Yellow Mosaic Virus. Specific functions, and accordingly utilities, of VGAM734 correlate with, and may be deduced from, the identity of the host target genes which VGAM734 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[29196] Nucleotide sequences of the VGAM734 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM734 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM734 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM734 are further described hereinbelow with reference to Table 1.

[29197] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM734 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM734 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29198] As mentioned hereinabove with reference to Fig. 1, a function of VGAM734 gene, herein designated VGAM is inhibition of expression of VGAM734 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM734 correlate with, and may be deduced from, the identity of the target genes which VGAM734 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[29199] APPL (Accession NM\_012096) is a VGAM734 host target gene. APPL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by APPL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APPL BINDING SITE, designated SEQ ID:14399, to the nucleotide sequence of VGAM734 RNA, herein designated VGAM RNA, also designated SEQ ID:3445.

[29200] A function of VGAM734 is therefore inhibition of APPL (Accession NM\_012096). Accordingly, utilities of VGAM734 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APPL. Protein Phosphatase 3 (formerly 2B), Catalytic Subunit, Beta Isoform (calcineurin A beta) (PPP3CB, Accession NM\_021132) is another VGAM734 host target gene. PPP3CB BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PPP3CB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP3CB BINDING SITE, designated SEQ

ID:22104, to the nucleotide sequence of VGAM734 RNA, herein designated VGAM RNA, also designated SEQ ID:3445.

[29201] Another function of VGAM734 is therefore inhibition of Protein Phosphatase 3 (formerly 2B), Catalytic Subunit, Beta Isoform (calcineurin A beta) (PPP3CB, Accession NM\_021132), a gene which is the catalytic subunit of calmodulin-stimulated protein phosphatase 3. Accordingly, utilities of VGAM734 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP3CB. The function of PPP3CB has been established by previous studies. See 114105. Guerini et al. (1989) identified and cloned human cDNA for the Ca(2+)-binding subunit of calcineurin, the brain isozyme of the Ca(2+)/calmodulin-stimulated protein phosphatase. The 2.5-kb cDNA had an open reading frame of 510 bp, a leader sequence of at least 500 bp, and a 1,277-bp 3-prime-noncoding sequence. As was observed with protein levels, mRNA abundance in brain was 20 to 60 times that found in other tissues with the exception of HeLa cells which, like brain, contained abundant calcineurin B mRNA. Animal model experiments lend further support to the function of PPP3CB. In cardiomyocytes, cal-

calcineurin signaling has been implicated in the regulation of the hypertrophic response caused by pressure overload or neuroendocrine stimulation. Bueno et al. (2002) evaluated the necessary function of calcineurin as a hypertrophic regulatory factor by disrupting 1 of the 3 genes that encode the catalytic subunit, calcineurin A-beta, in the mouse. Calcineurin A-beta-deficient mice were viable, fertile, and overtly normal into adulthood, but displayed an 80% decrease in calcineurin enzymatic activity in the heart that was associated with a 12% reduction in basal heart size. Deficient mice were dramatically impaired in their ability to mount a productive hypertrophic response induced by pressure overload, angiotensin II (OMIM Ref. No. 300034) infusion, or isoproterenol infusion. Analysis of marker genes associated with the hypertrophic response revealed a partial defect in the molecular program of hypertrophy. Collectively, these data solidified the hypothesis that calcineurin functions as a central regulator of the cardiac hypertrophic growth response in vivo.

[29202] It is appreciated that the abovementioned animal model for PPP3CB is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[29203] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[29204] Guerini, D.; Krinks, M. H.; Sikela, J. M.; Hahn, W. E.; Klee, C. B. : Isolation and sequence of a cDNA clone for human calcineurin B, the  $\text{Ca}(2+)$ -binding subunit of the  $\text{Ca}(2+)$ /calmodulin-stimulated protein phosphatase. DNA 8: 675-682, 1989. ; and

[29205] Bueno, O. F.; Wilkins, B. J.; Tymitz, K. M.; Glascock, B. J.; Kimball, T. F.; Lorenz, J. N.; Molkentin, J. D. : Impaired cardiac hypertrophic response in calcineurin A-beta-deficient mic.

[29206] Further studies establishing the function and utilities of PPP3CB are found in John Hopkins OMIM database record ID 114106, and in cited publications numbered 469 and 4691-4692 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. ARPP-19 (Accession NM\_006628) is another VGAM734 host target gene. ARPP-19 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARPP-19, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of ARPP-19 BINDING SITE, designated SEQ ID:13423, to the nucleotide sequence of VGAM734 RNA, herein designated VGAM RNA, also designated SEQ ID:3445.

[29207] Another function of VGAM734 is therefore inhibition of ARPP-19 (Accession NM\_006628). Accordingly, utilities of VGAM734 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARPP-19. Chromosome 20 Open Reading Frame 26 (C20orf26, Accession XM\_046598) is another VGAM734 host target gene. C20orf26 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by C20orf26, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf26 BINDING SITE, designated SEQ ID:34758, to the nucleotide sequence of VGAM734 RNA, herein designated VGAM RNA, also designated SEQ ID:3445.

[29208] Another function of VGAM734 is therefore inhibition of Chromosome 20 Open Reading Frame 26 (C20orf26, Accession XM\_046598). Accordingly, utilities of VGAM734 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with C20orf26. Claudin 1 (CLDN1, Accession NM\_021101) is another VGAM734 host target gene. CLDN1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CLDN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLDN1 BINDING SITE, designated SEQ ID:22081, to the nucleotide sequence of VGAM734 RNA, herein designated VGAM RNA, also designated SEQ ID:3445.

[29209] Another function of VGAM734 is therefore inhibition of Claudin 1 (CLDN1, Accession NM\_021101). Accordingly, utilities of VGAM734 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLDN1. FLJ12697 (Accession XM\_166526) is another VGAM734 host target gene. FLJ12697 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12697, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12697 BINDING SITE, designated SEQ ID:44472, to the nucleotide

sequence of VGAM734 RNA, herein designated VGAM RNA, also designated SEQ ID:3445.

[29210] Another function of VGAM734 is therefore inhibition of FLJ12697 (Accession XM\_166526). Accordingly, utilities of VGAM734 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12697. FLJ14154 (Accession NM\_024845) is another VGAM734 host target gene. FLJ14154 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14154, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14154 BINDING SITE, designated SEQ ID:24270, to the nucleotide sequence of VGAM734 RNA, herein designated VGAM RNA, also designated SEQ ID:3445.

[29211] Another function of VGAM734 is therefore inhibition of FLJ14154 (Accession NM\_024845). Accordingly, utilities of VGAM734 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14154. ICAP-1A (Accession NM\_004763) is another VGAM734 host target gene. ICAP-1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by ICAP-1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ICAP-1A BINDING SITE, designated SEQ ID:11155, to the nucleotide sequence of VGAM734 RNA, herein designated VGAM RNA, also designated SEQ ID:3445.

[29212] Another function of VGAM734 is therefore inhibition of ICAP-1A (Accession NM\_004763). Accordingly, utilities of VGAM734 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ICAP-1A. KIAA0186 (Accession NM\_021067) is another VGAM734 host target gene. KIAA0186 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0186, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0186 BINDING SITE, designated SEQ ID:22037, to the nucleotide sequence of VGAM734 RNA, herein designated VGAM RNA, also designated SEQ ID:3445.

[29213] Another function of VGAM734 is therefore inhibition of KIAA0186 (Accession NM\_021067). Accordingly, utilities

of VGAM734 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0186. KIAA0527 (Accession XM\_171054) is another VGAM734 host target gene. KIAA0527 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0527, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0527 BINDING SITE, designated SEQ ID:45848, to the nucleotide sequence of VGAM734 RNA, herein designated VGAM RNA, also designated SEQ ID:3445.

[29214] Another function of VGAM734 is therefore inhibition of KIAA0527 (Accession XM\_171054). Accordingly, utilities of VGAM734 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0527. MGC15438 (Accession NM\_032874) is another VGAM734 host target gene. MGC15438 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC15438, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

MGC15438 BINDING SITE, designated SEQ ID:26692, to the nucleotide sequence of VGAM734 RNA, herein designated VGAM RNA, also designated SEQ ID:3445.

[29215] Another function of VGAM734 is therefore inhibition of MGC15438 (Accession NM\_032874). Accordingly, utilities of VGAM734 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15438. poly(A) Polymerase Gamma (PAPOLG, Accession NM\_022894) is another VGAM734 host target gene. PAPOLG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PAPOLG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAPOLG BINDING SITE, designated SEQ ID:23155, to the nucleotide sequence of VGAM734 RNA, herein designated VGAM RNA, also designated SEQ ID:3445.

[29216] Another function of VGAM734 is therefore inhibition of poly(A) Polymerase Gamma (PAPOLG, Accession NM\_022894). Accordingly, utilities of VGAM734 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAPOLG. LOC161742

(Accession XM\_091095) is another VGAM734 host target gene. LOC161742 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC161742, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC161742 BINDING SITE, designated SEQ ID:40027, to the nucleotide sequence of VGAM734 RNA, herein designated VGAM RNA, also designated SEQ ID:3445.

[29217] Another function of VGAM734 is therefore inhibition of LOC161742 (Accession XM\_091095). Accordingly, utilities of VGAM734 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC161742. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 735 (VGAM735) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29218] VGAM735 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM735 was detected is described hereinabove with reference to Figs. 1–8.

[29219] VGAM735 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Barley Yellow Mosaic Virus. VGAM735 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29220] VGAM735 gene encodes a VGAM735 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM735 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM735 precursor RNA is designated SEQ ID:721, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:721 is located at position 755 relative to the genome of Barley Yellow Mosaic Virus.

[29221] VGAM735 precursor RNA folds onto itself, forming VGAM735 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence

of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29222] An enzyme complex designated DICER COMPLEX, `dices` the VGAM735 folded precursor RNA into VGAM735 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM735 RNA is designated SEQ ID:3446, and is provided hereinbelow with reference to the sequence listing part.

[29223] VGAM735 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM735 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM735 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[29224] VGAM735 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM735 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM735 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM735 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM735 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[29225] The complementary binding of VGAM735 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM735 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM735 host target RNA into VGAM735 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29226] It is appreciated that VGAM735 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM735 host target genes. The mRNA of each one of this plurality of VGAM735 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM735 RNA, herein designated VGAM RNA, and which when bound by VGAM735 RNA causes inhibition of translation of respective one or more VGAM735 host target proteins.

[29227] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM735 gene, herein designated VGAM GENE, on one or more VGAM735 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[29228] It is yet further appreciated that a function of VGAM735 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM735 include diagnosis, prevention and treatment of viral infection by Barley Yellow Mosaic Virus. Specific functions, and accordingly utilities, of VGAM735 correlate with, and may be deduced from, the identity of the host target genes which VGAM735 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29229] Nucleotide sequences of the VGAM735 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM735 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM735 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM735 are further described hereinbelow with reference to Table 1.

[29230] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM735 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM735 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29231] As mentioned hereinabove with reference to Fig. 1, a function of VGAM735 gene, herein designated VGAM is inhibition of expression of VGAM735 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM735 correlate with, and may be deduced from, the identity of the target genes which VGAM735 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29232] SH2 Domain Containing Phosphatase Anchor Protein 1 (SPAP1, Accession NM\_030764) is a VGAM735 host target gene. SPAP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

SPAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPAP1 BINDING SITE, designated SEQ ID:25047, to the nucleotide sequence of VGAM735 RNA, herein designated VGAM RNA, also designated SEQ ID:3446.

[29233] A function of VGAM735 is therefore inhibition of SH2 Domain Containing Phosphatase Anchor Protein 1 (SPAP1, Accession NM\_030764), a gene which regulation of immunologic function. Accordingly, utilities of VGAM735 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPAP1. The function of SPAP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM672. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 736 (VGAM736) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29234] VGAM736 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM736 was detected is described hereinabove with reference to Figs. 1–8.

[29235] VGAM736 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Barley Yellow Mosaic Virus. VGAM736 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29236] VGAM736 gene encodes a VGAM736 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM736 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM736 precursor RNA is designated SEQ ID:722, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:722 is located at position 3609 relative to the genome of Barley Yellow Mosaic Virus.

[29237] VGAM736 precursor RNA folds onto itself, forming VGAM736 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA

genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29238] An enzyme complex designated DICER COMPLEX, `dices` the VGAM736 folded precursor RNA into VGAM736 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM736 RNA is designated SEQ ID:3447, and is provided hereinbelow with reference to the sequence listing part.

[29239] VGAM736 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM736 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM736 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[29240] VGAM736 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM736 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM736 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM736 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM736 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[29241] The complementary binding of VGAM736 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM736 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM736 host target RNA into VGAM736 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29242] It is appreciated that VGAM736 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM736 host target genes. The mRNA of each one of this plurality of VGAM736 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM736 RNA, herein designated VGAM RNA, and which when bound by VGAM736 RNA causes inhibition of translation of respective one or more VGAM736 host target proteins.

[29243] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM736 gene, herein designated VGAM GENE, on one or more VGAM736 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[29244] It is yet further appreciated that a function of VGAM736 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM736 include diagnosis, prevention and treatment of viral infection by Barley Yellow Mosaic Virus. Specific functions, and accordingly utilities, of VGAM736 correlate with, and may be deduced from, the identity of the host target genes which VGAM736 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29245] Nucleotide sequences of the VGAM736 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

5`diced` VGAM736 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM736 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM736 are further described hereinbelow with reference to Table 1.

[29246] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM736 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM736 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29247] As mentioned hereinabove with reference to Fig. 1, a function of VGAM736 gene, herein designated VGAM is inhibition of expression of VGAM736 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM736 correlate with, and may be deduced from, the identity of the target genes which VGAM736 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29248] Tensin (TNS, Accession NM\_022648) is a VGAM736 host target gene. TNS BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded

by TNS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNS BINDING SITE, designated SEQ ID:22899, to the nucleotide sequence of VGAM736 RNA, herein designated VGAM RNA, also designated SEQ ID:3447.

[29249] A function of VGAM736 is therefore inhibition of Tensin (TNS, Accession NM\_022648). Accordingly, utilities of VGAM736 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNS. FLJ21438 (Accession XM\_029084) is another VGAM736 host target gene. FLJ21438 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ21438, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21438 BINDING SITE, designated SEQ ID:30844, to the nucleotide sequence of VGAM736 RNA, herein designated VGAM RNA, also designated SEQ ID:3447.

[29250] Another function of VGAM736 is therefore inhibition of FLJ21438 (Accession XM\_029084). Accordingly, utilities of

VGAM736 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21438. KIAA1036 (Accession NM\_014909) is another VGAM736 host target gene. KIAA1036 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1036, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1036 BINDING SITE, designated SEQ ID:17128, to the nucleotide sequence of VGAM736 RNA, herein designated VGAM RNA, also designated SEQ ID:3447.

[29251] Another function of VGAM736 is therefore inhibition of KIAA1036 (Accession NM\_014909). Accordingly, utilities of VGAM736 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1036. KIAA1950 (Accession XM\_166532) is another VGAM736 host target gene. KIAA1950 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1950, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1950 BINDING SITE, designated SEQ ID:44488, to the nucleotide sequence of VGAM736 RNA, herein designated VGAM RNA, also designated SEQ ID:3447.

[29252] Another function of VGAM736 is therefore inhibition of KIAA1950 (Accession XM\_166532). Accordingly, utilities of VGAM736 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1950. MGC19556 (Accession NM\_033551) is another VGAM736 host target gene. MGC19556 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC19556, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC19556 BINDING SITE, designated SEQ ID:27314, to the nucleotide sequence of VGAM736 RNA, herein designated VGAM RNA, also designated SEQ ID:3447.

[29253] Another function of VGAM736 is therefore inhibition of MGC19556 (Accession NM\_033551). Accordingly, utilities of VGAM736 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC19556. LOC254428 (Accession XM\_170932) is another VGAM736 host target gene. LOC254428 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254428, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254428 BINDING SITE, designated SEQ ID:45714, to the nucleotide sequence of VGAM736 RNA, herein designated VGAM RNA, also designated SEQ ID:3447.

[29254] Another function of VGAM736 is therefore inhibition of LOC254428 (Accession XM\_170932). Accordingly, utilities of VGAM736 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254428. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 737 (VGAM737) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29255] VGAM737 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM737 was detected is described hereinabove with reference to Figs. 1-8.

[29256] VGAM737 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Barley Yellow Mosaic Virus. VGAM737 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29257] VGAM737 gene encodes a VGAM737 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM737 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM737 precursor RNA is designated SEQ ID:723, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:723 is located at position 2030 relative to the genome of Barley Yellow Mosaic Virus.

[29258] VGAM737 precursor RNA folds onto itself, forming VGAM737 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nu-

cleotide sequence of the second half thereof.

[29259] An enzyme complex designated DICER COMPLEX, `dices` the VGAM737 folded precursor RNA into VGAM737 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 63%) nucleotide sequence of VGAM737 RNA is designated SEQ ID:3448, and is provided hereinbelow with reference to the sequence listing part.

[29260] VGAM737 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM737 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM737 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[29261] VGAM737 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM737 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM737 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM737 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM737 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[29262] The complementary binding of VGAM737 RNA, herein designated VGAM RNA, to host target binding sites on VGAM737 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM737 host target RNA into VGAM737 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29263] It is appreciated that VGAM737 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM737 host target genes. The mRNA of each one of this plurality of VGAM737 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM737 RNA, herein designated VGAM RNA, and which when bound by VGAM737 RNA causes inhibition of translation of respective one or more VGAM737 host target proteins.

[29264] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM737 gene, herein designated VGAM GENE, on one or more VGAM737 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[29265] It is yet further appreciated that a function of VGAM737 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM737 include diagnosis, prevention and treatment of viral infection by Barley Yellow Mosaic Virus. Specific functions, and accordingly utilities, of VGAM737 correlate with, and may be deduced from, the identity of the host target genes which VGAM737 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29266] Nucleotide sequences of the VGAM737 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM737 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM737 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM737 are further described hereinbelow with reference to Table 1.

[29267] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM737 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM737 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29268] As mentioned hereinabove with reference to Fig. 1, a function of VGAM737 gene, herein designated VGAM is inhibition of expression of VGAM737 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM737 correlate with, and may be deduced from, the identity of the target genes which VGAM737 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29269] Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM\_001748) is a VGAM737 host target gene. CAPN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAPN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of CAPN2 BINDING SITE, designated SEQ ID:7486, to the nucleotide sequence of VGAM737 RNA, herein designated VGAM RNA, also designated SEQ ID:3448.

[29270] A function of VGAM737 is therefore inhibition of Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM\_001748). Accordingly, utilities of VGAM737 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPN2. Corticotropin Releasing Hormone Receptor 2 (CRHR2, Accession NM\_001883) is another VGAM737 host target gene. CRHR2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CRHR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRHR2 BINDING SITE, designated SEQ ID:7609, to the nucleotide sequence of VGAM737 RNA, herein designated VGAM RNA, also designated SEQ ID:3448.

[29271] Another function of VGAM737 is therefore inhibition of Corticotropin Releasing Hormone Receptor 2 (CRHR2, Accession NM\_001883), a gene which is a corticotropin releasing factor receptor type II. Accordingly, utilities of

VGAM737 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRHR2. The function of CRHR2 has been established by previous studies. Corticotropin-releasing hormone (CRH; 122560) is a 41-amino acid peptide synthesized in the hypothalamus. It is the principal neuroregulator of the hypothalamic-pituitary-adrenocortical axis and plays an important role in coordinating the endocrine, autonomic, and behavioral responses to stress and immune challenge. Liaw et al. (1996) stated that there are 2 G protein-coupled CRH receptors, CRHR1 (OMIM Ref. No. 122561) and CRHR2, which they termed the CRF2 receptor. The investigators used clones of the rat CRF2 receptor to isolate the human gene from brain and kidney genomic DNA libraries. The gene consists of 12 exons spanning approximately 30 kb. The predicted protein, which is 411 amino acids in length and 70% identical to the CRF1 receptor, contains a putative N-terminal secretory signal sequence and 7 putative transmembrane domains. Liaw et al. (1996) expressed the CRF2 receptor and found that transfected cells responded to the binding of CRH with an increase in intracellular cAMP. Although the rat receptor has 2 alternatively spliced variants, termed CRF2-alpha and CRF2-beta, Liaw et al.

(1996) found no evidence for alternative splicing of the human receptor. Liaw et al. (1996) reported that the pharmacologic profile of this protein was similar to that of the rat CRF2- $\alpha$  protein but distinct from the human CRF1 receptor. Kostich et al. (1998) reported a novel CRHR2 splice isoform, which they referred to as 'CRF2- $\gamma$ ,' found in human brain. CRF2- $\gamma$  cDNA encodes a 397-amino acid receptor containing an amino terminus with no significant homology to the already reported  $\alpha$ - and  $\beta$ -termini. PCR and Southern blot analysis of CRF2- $\gamma$  RNA expression in human brain detected expression in the septum and hippocampus, with weaker but detectable expression in the amygdala, nucleus accumbens, midbrain, and frontal cortex. Animal model experiments lend further support to the function of CRHR2. Kishimoto et al. (2000) generated mice deficient for *Crhr2* by targeted disruption. They reported that male but not female *Crhr2*-deficient mice exhibited enhanced anxious behavior in several tests of anxiety in contrast to mice lacking *Crhr1*. The enhanced anxiety of *Crhr2*-deficient mice was not due to changes in hypothalamic-pituitary-adrenal axis activity, but rather reflected impaired responses in specific brain regions involved in emotional

and autonomic functions, as monitored by a reduction in Creb phosphorylation in male, but not female, *Crhr2*  $-/-$  mice. Kishimoto et al. (2000) proposed that CRHR1 predominantly mediates a central anxiolytic response, opposing the general anxiogenic effect of CRH mediated by CRHR1. Kishimoto et al. (2000) found that neither male nor female *Crhr2*-deficient mice showed alterations of baseline feeding behavior. Both responded with increased edema formation in response to thermal exposure, however, indicating that in contrast to its central role in anxiety, the peripheral role of CRHR2 in vascular permeability is independent of gender.

[29272] It is appreciated that the abovementioned animal model for CRHR2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[29273] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[29274] Kostich, W. A.; Chen, A.; Sperle, K.; Largent, B. L. : Molecular identification and analysis of a novel human corticotropin-releasing factor (CRF) receptor: the CRF2-gamma receptor. *Molec. Endocr.* 12: 1077-1085,

1998. ; and

[29275] Kishimoto, T.; Radulovic, J.; Radulovic, M.; Lin, C. R.; Schrick, C.; Hooshmand, F.; Hermanson, O.; Rosenfeld, M. G.; Spiess, J. : Deletion of Crhr2 reveals an anxiolytic role for cortic.

[29276] Further studies establishing the function and utilities of CRHR2 are found in John Hopkins OMIM database record ID 602034, and in cited publications numbered 943-94 and 1988-950 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Muscleblind-like (Drosophila) (MBNL, Accession NM\_021038) is another VGAM737 host target gene. MBNL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MBNL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MBNL BINDING SITE, designated SEQ ID:22030, to the nucleotide sequence of VGAM737 RNA, herein designated VGAM RNA, also designated SEQ ID:3448.

[29277] Another function of VGAM737 is therefore inhibition of Muscleblind-like (Drosophila) (MBNL, Accession NM\_021038), a gene which binds to cug triplet repeat ex-

pansion dsrna (by similarity). Accordingly, utilities of VGAM737 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MBNL. The function of MBNL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM95. MADS Box Transcription Enhancer Factor 2, Polypeptide C (myocyte enhancer factor 2C) (MEF2C, Accession NM\_002397) is another VGAM737 host target gene. MEF2C BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MEF2C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEF2C BINDING SITE, designated SEQ ID:8212, to the nucleotide sequence of VGAM737 RNA, herein designated VGAM RNA, also designated SEQ ID:3448.

[29278] Another function of VGAM737 is therefore inhibition of MADS Box Transcription Enhancer Factor 2, Polypeptide C (myocyte enhancer factor 2C) (MEF2C, Accession NM\_002397), a gene which regulates muscle-specific and mitogen-inducible genes. Accordingly, utilities of

VGAM737 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEF2C. The function of MEF2C and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM386.8-oxoguanine DNA Glycosylase (OGG1, Accession NM\_002542) is another VGAM737 host target gene. OGG1 BINDING SITE1 through OGG1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by OGG1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OGG1 BINDING SITE1 through OGG1 BINDING SITE3, designated SEQ ID:8393, SEQ ID:18810 and SEQ ID:18815 respectively, to the nucleotide sequence of VGAM737 RNA, herein designated VGAM RNA, also designated SEQ ID:3448.

[29279] Another function of VGAM737 is therefore inhibition of 8-oxoguanine DNA Glycosylase (OGG1, Accession NM\_002542), a gene which is involved in base excision DNA repair and removal of 8-oxyguanine. Accordingly, utilities of VGAM737 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with OGG1. The function of OGG1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM390. Phosphotriesterase Related (PTER, Accession NM\_030664) is another VGAM737 host target gene. PTER BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTER, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTER BINDING SITE, designated SEQ ID:24999, to the nucleotide sequence of VGAM737 RNA, herein designated VGAM RNA, also designated SEQ ID:3448.

[29280] Another function of VGAM737 is therefore inhibition of Phosphotriesterase Related (PTER, Accession NM\_030664), a gene which is a phosphotriesterase homology protein. Accordingly, utilities of VGAM737 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTER. The function of PTER and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM713. Retinoic Acid Receptor, Beta (RARβ, Accession NM\_016152) is another

VGAM737 host target gene. RARB BINDING SITE1 and RARB BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RARB, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RARB BINDING SITE1 and RARB BINDING SITE2, designated SEQ ID:18239 and SEQ ID:6693 respectively, to the nucleotide sequence of VGAM737 RNA, herein designated VGAM RNA, also designated SEQ ID:3448.

[29281] Another function of VGAM737 is therefore inhibition of Retinoic Acid Receptor, Beta (RARB, Accession NM\_016152), a gene which is one member of the steroid/thyroid hormone receptor family of ligand-activated transcription factors. Accordingly, utilities of VGAM737 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RARB. The function of RARB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM179. Thioredoxin Interacting Protein (TXNIP, Accession NM\_006472) is another VGAM737 host target gene. TXNIP BINDING SITE is HOST TARGET binding site found in

the 3' untranslated region of mRNA encoded by TXNIP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TXNIP BINDING SITE, designated SEQ ID:13196, to the nucleotide sequence of VGAM737 RNA, herein designated VGAM RNA, also designated SEQ ID:3448.

[29282] Another function of VGAM737 is therefore inhibition of Thioredoxin Interacting Protein (TXNIP, Accession NM\_006472), a gene which binds and inhibits thioredoxin, a major regulator of cellular redox state. Accordingly, utilities of VGAM737 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TXNIP. The function of TXNIP has been established by previous studies. Exposure to vitamin D3 (1,25-dihydroxyvitamin D3) or phorbol ester induces the bipotent HL-60 cell promyelocytic leukemia cell line to differentiate into monocytes/macrophages, whereas retinoic acid and dimethylsulfoxide induce differentiation towards granulocytes. The differentiation is accompanied by regulation of MYC (OMIM Ref. No. 190080), FOS (OMIM Ref. No. 164810), FMS (CSF1R; 164770), and myeloblastin (PRTN3; 177020). By differential screening of HL60 cell

lines, Chen and DeLuca (1994) identified a cDNA encoding TXNIP, which they termed VDUP1. The deduced TXNIP protein has 391 amino acids. Ribonuclease protection analysis showed dramatically increased expression of TXNIP in response to vitamin D3 but not to phorbol ester. Chen and DeLuca (1994) concluded that TXNIP is not involved in the differentiation process. Familial combined hyperlipidemia (OMIM Ref. No. 144250) is a common, multifactorial and heterogeneous dyslipidemia predisposing to premature coronary artery disease and characterized by elevated plasma triglycerides, cholesterol, or both. Castellani et al. (1998) identified a mouse mutant strain, HcB-19, that shares features with familial combined hyperlipidemia, including hypertriglyceridemia, hypercholesterolemia, elevated plasma apolipoprotein B, and increased secretion of triglyceride-rich lipoproteins. This disorder was shown to result from spontaneous mutation at a locus, designated Hyplip1, on distal mouse chromosome 3 in a region syntenic to 1q21-q23, where a locus for familial combined hyperlipidemia was identified in Finnish, German, Chinese, and U.S. families. By positional cloning, Bodnar et al. (2002) demonstrated that the Hyplip1 gene is Txnip, and they demonstrated a Txnip non-

sense mutation in the HcB-19 strain that was absent in its normolipidemic parental strains. Txnip encodes a cytoplasmic protein that binds and inhibits thioredoxin, a major regulator of cellular redox state. The mutant mice showed a decreased flux of fatty acids through the TCA cycle, resulting in increased availability for ketogenesis and triglyceride synthesis. The authors suggested further studies to elucidate the potential role of the human homolog in familial combined hyperlipidemia and other metabolic disorder

[29283] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[29284] Chen, K.-S.; DeLuca, H. F. : Isolation and characterization of a novel cDNA from HL-60 cells treated with 1,25-dihydroxyvitamin D-3. *Biochim. Biophys. Acta* 1219: 26-32, 1994. ; and

[29285] Bodnar, J. S.; Chatterjee, A.; Castellani, L. W.; Ross, D. A.; Ohmen, J.; Cavalcoli, J.; Wu, C.; Dains, K. M.; Catanese, J.; Chu, M.; Sheth, S. S.; Charugundla, K.; Demant, P.; West, D. B.;.

[29286] Further studies establishing the function and utilities of TXNIP are found in John Hopkins OMIM database record ID

606599, and in cited publications numbered 103 and 4515–4516 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. KIAA0935 (Accession XM\_052620) is another VGAM737 host target gene. KIAA0935 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0935, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0935 BINDING SITE, designated SEQ ID:36013, to the nucleotide sequence of VGAM737 RNA, herein designated VGAM RNA, also designated SEQ ID:3448.

[29287] Another function of VGAM737 is therefore inhibition of KIAA0935 (Accession XM\_052620). Accordingly, utilities of VGAM737 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0935. KIAA0937 (Accession XM\_166213) is another VGAM737 host target gene. KIAA0937 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0937, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA0937 BINDING SITE, designated SEQ ID:44019, to the nucleotide sequence of VGAM737 RNA, herein designated VGAM RNA, also designated SEQ ID:3448.

[29288] Another function of VGAM737 is therefore inhibition of KIAA0937 (Accession XM\_166213). Accordingly, utilities of VGAM737 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0937. KIAA1303 (Accession XM\_038376) is another VGAM737 host target gene. KIAA1303 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1303, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1303 BINDING SITE, designated SEQ ID:32831, to the nucleotide sequence of VGAM737 RNA, herein designated VGAM RNA, also designated SEQ ID:3448.

[29289] Another function of VGAM737 is therefore inhibition of KIAA1303 (Accession XM\_038376). Accordingly, utilities of VGAM737 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1303. OS-9 (Accession NM\_006812) is another

VGAM737 host target gene. OS-9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OS-9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OS-9 BINDING SITE, designated SEQ ID:13683, to the nucleotide sequence of VGAM737 RNA, herein designated VGAM RNA, also designated SEQ ID:3448.

[29290] Another function of VGAM737 is therefore inhibition of OS-9 (Accession NM\_006812). Accordingly, utilities of VGAM737 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OS-9. Sideroflexin 2 (SFXN2, Accession XM\_058359) is another VGAM737 host target gene. SFXN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SFXN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SFXN2 BINDING SITE, designated SEQ ID:36601, to the nucleotide sequence of VGAM737 RNA, herein designated VGAM RNA, also designated SEQ ID:3448.

[29291] Another function of VGAM737 is therefore inhibition of Sideroflexin 2 (SFXN2, Accession XM\_058359). Accordingly, utilities of VGAM737 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFXN2. Smith–Magenis Syndrome Chromosome Region, Candidate 5 (SMCR5, Accession NM\_144774) is another VGAM737 host target gene. SMCR5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SMCR5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMCR5 BINDING SITE, designated SEQ ID:29565, to the nucleotide sequence of VGAM737 RNA, herein designated VGAM RNA, also designated SEQ ID:3448.

[29292] Another function of VGAM737 is therefore inhibition of Smith–Magenis Syndrome Chromosome Region, Candidate 5 (SMCR5, Accession NM\_144774). Accordingly, utilities of VGAM737 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMCR5. Signal Sequence Receptor, Alpha (translocon–associated protein alpha) (SSR1, Accession NM\_003144) is another VGAM737 host target gene. SSR1 BINDING SITE is HOST

TARGET binding site found in the 3' untranslated region of mRNA encoded by SSR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SSR1 BINDING SITE, designated SEQ ID:9112, to the nucleotide sequence of VGAM737 RNA, herein designated VGAM RNA, also designated SEQ ID:3448.

[29293] Another function of VGAM737 is therefore inhibition of Signal Sequence Receptor, Alpha (translocon-associated protein alpha) (SSR1, Accession NM\_003144). Accordingly, utilities of VGAM737 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SSR1. Syntaxin 3A (STX3A, Accession NM\_004177) is another VGAM737 host target gene. STX3A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STX3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STX3A BINDING SITE, designated SEQ ID:10388, to the nucleotide sequence of VGAM737 RNA, herein designated VGAM RNA, also designated SEQ ID:3448.

[29294] Another function of VGAM737 is therefore inhibition of Syntaxin 3A (STX3A, Accession NM\_004177). Accordingly, utilities of VGAM737 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STX3A. LOC149842 (Accession XM\_097745) is another VGAM737 host target gene. LOC149842 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149842, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149842 BINDING SITE, designated SEQ ID:41091, to the nucleotide sequence of VGAM737 RNA, herein designated VGAM RNA, also designated SEQ ID:3448.

[29295] Another function of VGAM737 is therefore inhibition of LOC149842 (Accession XM\_097745). Accordingly, utilities of VGAM737 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149842. LOC221143 (Accession XM\_167986) is another VGAM737 host target gene. LOC221143 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221143, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221143 BINDING SITE, designated SEQ ID:44944, to the nucleotide sequence of VGAM737 RNA, herein designated VGAM RNA, also designated SEQ ID:3448.

[29296] Another function of VGAM737 is therefore inhibition of LOC221143 (Accession XM\_167986). Accordingly, utilities of VGAM737 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221143. LOC254394 (Accession XM\_171127) is another VGAM737 host target gene. LOC254394 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254394, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254394 BINDING SITE, designated SEQ ID:45930, to the nucleotide sequence of VGAM737 RNA, herein designated VGAM RNA, also designated SEQ ID:3448.

[29297] Another function of VGAM737 is therefore inhibition of LOC254394 (Accession XM\_171127). Accordingly, utilities of VGAM737 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC254394. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 738 (VGAM738) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29298] VGAM738 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM738 was detected is described hereinabove with reference to Figs. 1–8.

[29299] VGAM738 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Barley Yellow Mosaic Virus. VGAM738 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29300] VGAM738 gene encodes a VGAM738 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM738 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM738 precursor RNA is designated SEQ ID:724, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:724 is located at position 3974 relative to the genome of Barley Yellow Mosaic Virus.

[29301] VGAM738 precursor RNA folds onto itself, forming VGAM738 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29302] An enzyme complex designated DICER COMPLEX, `dices` the VGAM738 folded precursor RNA into VGAM738 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM738 RNA is designated SEQ ID:3449, and is provided hereinbelow with reference to the sequence listing part.

[29303] VGAM738 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM738 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM738 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[29304] VGAM738 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM738 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM738 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM738 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM738 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[29305] The complementary binding of VGAM738 RNA, herein designated VGAM RNA, to host target binding sites on VGAM738 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM738 host target RNA into VGAM738 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29306] It is appreciated that VGAM738 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM738 host target genes. The mRNA of each one of this plurality of VGAM738 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM738 RNA, herein designated VGAM RNA, and which when bound by VGAM738 RNA causes in-

hibition of translation of respective one or more VGAM738 host target proteins.

[29307] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM738 gene, herein designated VGAM GENE, on one or more VGAM738 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[29308] It is yet further appreciated that a function of VGAM738 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM738 include diagnosis, prevention and

treatment of viral infection by Barley Yellow Mosaic Virus. Specific functions, and accordingly utilities, of VGAM738 correlate with, and may be deduced from, the identity of the host target genes which VGAM738 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [29309] Nucleotide sequences of the VGAM738 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM738 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM738 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM738 are further described hereinbelow with reference to Table 1.
- [29310] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM738 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM738 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [29311] As mentioned hereinabove with reference to Fig. 1, a function of VGAM738 gene, herein designated VGAM is inhibition of expression of VGAM738 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM738 correlate with, and may be deduced from, the identity of the target genes which VGAM738 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29312] Ecotropic Viral Integration Site 2A (EVI2A, Accession NM\_014210) is a VGAM738 host target gene. EVI2A BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by EVI2A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EVI2A BINDING SITE, designated SEQ ID:15477, to the nucleotide sequence of VGAM738 RNA, herein designated VGAM RNA, also designated SEQ ID:3449.

[29313] A function of VGAM738 is therefore inhibition of Ecotropic Viral Integration Site 2A (EVI2A, Accession NM\_014210), a gene which may complex with itself or/and other proteins within the membrane, to function as part of a cell-surface receptor. Accordingly, utilities of VGAM738 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EVI2A. The function of EVI2A has been established by previous studies. O'Connell et al.

(1989, 1990) demonstrated by genetic linkage and by somatic cell hybrid and pulsed field gel electrophoresis that EVI2, the human homolog of the mouse myeloid leukemia-associated gene Evi2, maps between 2 breakpoints on the proximal part of 17q that define the location of the gene for neurofibromatosis (OMIM Ref. No. 162200). Sequencing studies predicted an EVI2 protein of 232 amino acids and structural features consistent with the view that EVI2 is a membrane protein that may complex with itself and/or other proteins within the membrane, perhaps to function as part of a cell-surface receptor. In the course of these studies of the structure of the EVI2 gene, Cawthon et al. (1990) identified 2 other transcripts that map between the NF1 translocation breakpoints. Collins (1993) symbolized this gene EVDA.

[29314] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[29315] O'Connell, P.; Viskochil, D.; Buchberg, A. M.; Fountain, J.; Cawthon, R. M.; Culver, M.; Stevens, J.; Rich, D. C.; Ledbetter, D. H.; Wallace, M.; Carey, J. C.; Jenkins, N. A.; Copeland, N. G.; Collins, F. S.; White, R. : The human homolog of murine Evi-2 lies between two von Reckling-

hausen neurofibromatosis translocations. Genomics 7: 547–554, 1990. ; and

[29316] Cawthon, R. M.; O'Connell, P.; Buchberg, A. M.; Viskochil, D.; Weiss, R. B.; Culver, M.; Stevens, J.; Jenkins, N. A.; Copeland, N. G.; White, R. : Identification and characterization of.

[29317] Further studies establishing the function and utilities of EVI2A are found in John Hopkins OMIM database record ID 158380, and in cited publications numbered 3803–3806 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. RecQ Protein–like 5 (RECQL5, Accession NM\_004259) is another VGAM738 host target gene. RECQL5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RECQL5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RECQL5 BINDING SITE, designated SEQ ID:10446, to the nucleotide sequence of VGAM738 RNA, herein designated VGAM RNA, also designated SEQ ID:3449.

[29318] Another function of VGAM738 is therefore inhibition of RecQ Protein–like 5 (RECQL5, Accession NM\_004259). Ac–

cordingly, utilities of VGAM738 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RECQL5. Thrombospondin 1 (THBS1, Accession NM\_003246) is another VGAM738 host target gene. THBS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by THBS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of THBS1 BINDING SITE, designated SEQ ID:9254, to the nucleotide sequence of VGAM738 RNA, herein designated VGAM RNA, also designated SEQ ID:3449.

[29319] Another function of VGAM738 is therefore inhibition of Thrombospondin 1 (THBS1, Accession NM\_003246), a gene which is a member of a family of adhesive molecules, involves in blood clotting and in angiogenesis. Accordingly, utilities of VGAM738 include diagnosis, prevention and treatment of diseases and clinical conditions associated with THBS1. The function of THBS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM20. Ras Homolog Gene Family, Member E (ARHE, Accession NM\_005168) is an-

other VGAM738 host target gene. ARHE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARHE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHE BINDING SITE, designated SEQ ID:11666, to the nucleotide sequence of VGAM738 RNA, herein designated VGAM RNA, also designated SEQ ID:3449.

[29320] Another function of VGAM738 is therefore inhibition of Ras Homolog Gene Family, Member E (ARHE, Accession NM\_005168). Accordingly, utilities of VGAM738 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHE. Eukaryotic Translation Initiation Factor 3, Subunit 1 Alpha, 35kDa (EIF3S1, Accession XM\_032384) is another VGAM738 host target gene. EIF3S1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EIF3S1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EIF3S1 BINDING SITE, designated SEQ ID:31640, to the nucleotide sequence of VGAM738 RNA,

herein designated VGAM RNA, also designated SEQ ID:3449.

[29321] Another function of VGAM738 is therefore inhibition of Eukaryotic Translation Initiation Factor 3, Subunit 1 Alpha, 35kDa (EIF3S1, Accession XM\_032384). Accordingly, utilities of VGAM738 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF3S1. FLJ20330 (Accession NM\_018988) is another VGAM738 host target gene. FLJ20330 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20330, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20330 BINDING SITE, designated SEQ ID:21058, to the nucleotide sequence of VGAM738 RNA, herein designated VGAM RNA, also designated SEQ ID:3449.

[29322] Another function of VGAM738 is therefore inhibition of FLJ20330 (Accession NM\_018988). Accordingly, utilities of VGAM738 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20330. KIAA1432 (Accession XM\_039698) is another VGAM738 host target gene. KIAA1432 BINDING SITE is HOST TARGET

binding site found in the 5' untranslated region of mRNA encoded by KIAA1432, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1432 BINDING SITE, designated SEQ ID:33149, to the nucleotide sequence of VGAM738 RNA, herein designated VGAM RNA, also designated SEQ ID:3449.

[29323] Another function of VGAM738 is therefore inhibition of KIAA1432 (Accession XM\_039698). Accordingly, utilities of VGAM738 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1432. P66 (Accession NM\_020699) is another VGAM738 host target gene. P66 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by P66, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P66 BINDING SITE, designated SEQ ID:21847, to the nucleotide sequence of VGAM738 RNA, herein designated VGAM RNA, also designated SEQ ID:3449.

[29324] Another function of VGAM738 is therefore inhibition of

P66 (Accession NM\_020699). Accordingly, utilities of VGAM738 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P66. Phosphatidylinositol-4-phosphate 5-kinase, Type II, Alpha (PIP5K2A, Accession NM\_005028) is another VGAM738 host target gene. PIP5K2A BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PIP5K2A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIP5K2A BINDING SITE, designated SEQ ID:11469, to the nucleotide sequence of VGAM738 RNA, herein designated VGAM RNA, also designated SEQ ID:3449.

[29325] Another function of VGAM738 is therefore inhibition of Phosphatidylinositol-4-phosphate 5-kinase, Type II, Alpha (PIP5K2A, Accession NM\_005028). Accordingly, utilities of VGAM738 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIP5K2A. Testis-specific Transcript, Y-linked 2 (TTY2, Accession XM\_099029) is another VGAM738 host target gene. TTY2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by

TTY2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TTY2 BINDING SITE, designated SEQ ID:42067, to the nucleotide sequence of VGAM738 RNA, herein designated VGAM RNA, also designated SEQ ID:3449.

[29326] Another function of VGAM738 is therefore inhibition of Testis-specific Transcript, Y-linked 2 (TTY2, Accession XM\_099029). Accordingly, utilities of VGAM738 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TTY2. LOC159148 (Accession XM\_099030) is another VGAM738 host target gene. LOC159148 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC159148, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC159148 BINDING SITE, designated SEQ ID:42074, to the nucleotide sequence of VGAM738 RNA, herein designated VGAM RNA, also designated SEQ ID:3449.

[29327] Another function of VGAM738 is therefore inhibition of

LOC159148 (Accession XM\_099030). Accordingly, utilities of VGAM738 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC159148. LOC221718 (Accession XM\_168062) is another VGAM738 host target gene. LOC221718 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221718, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221718 BINDING SITE, designated SEQ ID:44981, to the nucleotide sequence of VGAM738 RNA, herein designated VGAM RNA, also designated SEQ ID:3449.

[29328] Another function of VGAM738 is therefore inhibition of LOC221718 (Accession XM\_168062). Accordingly, utilities of VGAM738 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221718. LOC256880 (Accession XM\_173135) is another VGAM738 host target gene. LOC256880 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256880, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC256880 BINDING SITE, designated SEQ ID:46384, to the nucleotide sequence of VGAM738 RNA, herein designated VGAM RNA, also designated SEQ ID:3449.

[29329] Another function of VGAM738 is therefore inhibition of LOC256880 (Accession XM\_173135). Accordingly, utilities of VGAM738 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256880. LOC90246 (Accession XM\_030283) is another VGAM738 host target gene. LOC90246 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90246, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90246 BINDING SITE, designated SEQ ID:31001, to the nucleotide sequence of VGAM738 RNA, herein designated VGAM RNA, also designated SEQ ID:3449.

[29330] Another function of VGAM738 is therefore inhibition of LOC90246 (Accession XM\_030283). Accordingly, utilities of VGAM738 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90246. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 739 (VGAM739) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29331] VGAM739 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM739 was detected is described hereinabove with reference to Figs. 1–8.

[29332] VGAM739 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Taura Syndrome Virus. VGAM739 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29333] VGAM739 gene encodes a VGAM739 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM739 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM739 precursor RNA is designated SEQ ID:725, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:725 is

located at position 4695 relative to the genome of Taura Syndrome Virus.

[29334] VGAM739 precursor RNA folds onto itself, forming VGAM739 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29335] An enzyme complex designated DICER COMPLEX, `dices` the VGAM739 folded precursor RNA into VGAM739 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM739 RNA is designated SEQ ID:3450, and is provided hereinbelow with reference to the sequence listing part.

[29336] VGAM739 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM739 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM739 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[29337] VGAM739 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM739 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM739 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM739 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM739 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[29338] The complementary binding of VGAM739 RNA, herein designated VGAM RNA, to host target binding sites on VGAM739 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM739 host target RNA into VGAM739 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29339] It is appreciated that VGAM739 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM739 host target genes. The mRNA of each one of this plurality of VGAM739 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM739 RNA, herein designated VGAM RNA, and which when bound by VGAM739 RNA causes inhibition of translation of respective one or more VGAM739

host target proteins.

[29340] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM739 gene, herein designated VGAM GENE, on one or more VGAM739 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[29341] It is yet further appreciated that a function of VGAM739 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM739 include diagnosis, prevention and treatment of viral infection by Taura Syndrome Virus. Spe-

cific functions, and accordingly utilities, of VGAM739 correlate with, and may be deduced from, the identity of the host target genes which VGAM739 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29342] Nucleotide sequences of the VGAM739 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM739 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM739 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM739 are further described hereinbelow with reference to Table 1.

[29343] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM739 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM739 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29344] As mentioned hereinabove with reference to Fig. 1, a function of VGAM739 gene, herein designated VGAM is inhibition of expression of VGAM739 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM739 correlate with, and may be deduced from, the identity of the target genes which VGAM739 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29345] Inhibitor of Kappa Light Polypeptide Gene Enhancer In B-cells, Kinase Gamma (IKBKG, Accession NM\_003639) is a VGAM739 host target gene. IKBKG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IKBKG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IKBKG BINDING SITE, designated SEQ ID:9712, to the nucleotide sequence of VGAM739 RNA, herein designated VGAM RNA, also designated SEQ ID:3450.

[29346] A function of VGAM739 is therefore inhibition of Inhibitor of Kappa Light Polypeptide Gene Enhancer In B-cells, Kinase Gamma (IKBKG, Accession NM\_003639), a gene which regulatory subunit part of the ikk-signalosome complex activation. also considered to be a mediator for tax activation of nf-kappa-b. could be implicated in nf-kappa-b-mediated protection from cytokine toxicity. Accordingly, utilities of VGAM739 include diagnosis, preven-

tion and treatment of diseases and clinical conditions associated with IKBKG. The function of IKBKG and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM471. Mdm4, Transformed 3T3 Cell Double Minute 4, P53 Binding Protein (mouse) (MDM4, Accession NM\_002393) is another VGAM739 host target gene. MDM4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MDM4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MDM4 BINDING SITE, designated SEQ ID:8209, to the nucleotide sequence of VGAM739 RNA, herein designated VGAM RNA, also designated SEQ ID:3450.

[29347] Another function of VGAM739 is therefore inhibition of Mdm4, Transformed 3T3 Cell Double Minute 4, P53 Binding Protein (mouse) (MDM4, Accession NM\_002393), a gene which Strongly similar to murine Mdm4; may interact with p53. Accordingly, utilities of VGAM739 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MDM4. The function of MDM4

has been established by previous studies. Shvarts et al. (1997) isolated cDNAs encoding MDM4 by screening a human cDNA library from a colonic tumorigenic cell line with a mouse mdmx probe. The human MDM4 gene encodes a 490-amino acid protein containing a RING finger domain and a putative nuclear localization signal. The predicted mass of the protein was 54 kD, while the observed mass was 80 kD, a difference which Shvarts et al. (1997) stated was probably due to phosphorylation or other posttranslational modification. Northern blot analysis revealed a 10-kb mRNA expressed at a high level in thymus and at lower levels in all other tissues tested. A 2.2-kb mRNA was detected in testis. MDM4 protein produced by in vitro translation interacts with p53 (OMIM Ref. No. 191170) via a binding domain located in the N-terminal region of the MDM4 protein. MDM4 shows significant structural similarity to p53-binding protein MDM2 (OMIM Ref. No. 164785), an E3 ubiquitin ligase. The interaction between MDM2 and p53 is critical for cell viability; loss of Mdm2 causes cell death in vitro and in vivo in a p53-dependent manner. MDM4 has some of the same properties as MDM2, but unlike MDM2, it does not cause nuclear export or degradation of p53. To study MDM4 function in vivo,

Parant et al. (2001) deleted the Mdm4 gene in mice. Mdm4-null mice died at 7.5 to 8.5 days postcoitum due to loss of cell proliferation. When Parant et al. (2001) crossed in a p53-null allele, they found that loss of p53 completely rescued the Mdm4 -/- embryonic lethality. Thus, MDM2 and MDM4 are nonoverlapping critical regulators of p53 in vivo. These data defined a new pathway of p53 regulation and raised the possibility that increased MDM4 levels and the resulting inactivation of p53 contribute to the development of human tumors. By fluorescence in situ hybridization, Shvarts et al. (1997) mapped the MDM4 gene to human chromosome 1q32.

[29348] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[29349] Parant, J.; Chavez-Reyes, A.; Little, N. A.; Yan, W.; Reinke, V.; Jochemsen, A. G.; Lozano, G. : Rescue of embryonic lethality in Mdm4-null mice by loss of Trp53 suggests a nonoverlapping pathway with MDM2 to regulate p53. *Nature Genet.* 29: 92-95, 2001. ; and

[29350] Shvarts, A.; Bazuine, M.; Dekker, P.; Ramos, Y. F. M.; Steengenga, W. T.; Merckx, G.; van Ham, R. C. A.; van der Hoven van Oordt, W.; van der Eb, A. J.; Jochemsen, A. G. :

Isolation an.

[29351] Further studies establishing the function and utilities of MDM4 are found in John Hopkins OMIM database record ID 602704, and in cited publications numbered 1046–1047 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Protein Phosphatase 2 (formerly 2A), Catalytic Subunit, Alpha Isoform (PPP2CA, Accession NM\_002715) is another VGAM739 host target gene. PPP2CA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP2CA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP2CA BINDING SITE, designated SEQ ID:8582, to the nucleotide sequence of VGAM739 RNA, herein designated VGAM RNA, also designated SEQ ID:3450.

[29352] Another function of VGAM739 is therefore inhibition of Protein Phosphatase 2 (formerly 2A), Catalytic Subunit, Alpha Isoform (PPP2CA, Accession NM\_002715), a gene which plays a role in the regulation of most major metabolic pathways. Accordingly, utilities of VGAM739 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with PPP2CA. The function of PPP2CA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM399. Synaptotagmin I (SYT1, Accession NM\_005639) is another VGAM739 host target gene. SYT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SYT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYT1 BINDING SITE, designated SEQ ID:12173, to the nucleotide sequence of VGAM739 RNA, herein designated VGAM RNA, also designated SEQ ID:3450.

[29353] Another function of VGAM739 is therefore inhibition of Synaptotagmin I (SYT1, Accession NM\_005639), a gene which may have a regulatory role in the membrane interactions during trafficking of synaptic vesicles at the active zone of the synapse. Accordingly, utilities of VGAM739 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYT1. The function of SYT1 has been established by previous studies. Perin et al. (1991) characterized full-length cDNAs encoding hu-

man and *Drosophila* synaptotagmins. Similarity of the phospholipid binding properties of the cytoplasmic domains of rat, human, and *Drosophila* synaptotagmins and selective conservation of the sequences that are homologous to protein kinase C (see OMIM Ref. No. 176960) suggested that these may be involved in phospholipid binding. Neurons release neurotransmitters by calcium-dependent exocytosis of synaptic vesicles. Brose et al. (1992) reported that synaptotagmin, a highly conserved synaptic vesicle protein, binds calcium at physiologic concentrations in a complex with negatively charged phospholipids. This binding is specific for calcium and involves the cytoplasmic domain of synaptotagmin. Calcium binding is dependent on the intact oligomeric structure of synaptotagmin; it is abolished by proteolytic cleavage at a single site. Brose et al. (1992) interpreted the results as suggesting that synaptotagmin acts as a cooperative calcium receptor in exocytosis. Synaptotagmin contains 2 copies of a sequence that is homologous to the regulatory region of protein kinase C (OMIM Ref. No. 176960).

[29354] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[29355] Brose, N.; Petrenko, A. G.; Sudhof, T. C.; Jahn, R. : Synaptotagmin: a calcium sensor on the synaptic vesicle surface. Science 256: 1021–1025, 1992. ; and

[29356] Perin, M. S.; Johnston, P. A.; Ozcelik, T.; Jahn, R.; Francke, U.; Sudhof, T. C. : Structural and functional conservation of synaptotagmin (p65) in Drosophila and humans. J. Biol. Chem.

[29357] Further studies establishing the function and utilities of SYT1 are found in John Hopkins OMIM database record ID 185605, and in cited publications numbered 1569–1580 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.FLJ22167 (Accession NM\_024533) is another VGAM739 host target gene. FLJ22167 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ22167, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22167 BINDING SITE, designated SEQ ID:23739, to the nucleotide sequence of VGAM739 RNA, herein designated VGAM RNA, also designated SEQ ID:3450.

[29358] Another function of VGAM739 is therefore inhibition of

FLJ22167 (Accession NM\_024533). Accordingly, utilities of VGAM739 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22167. General Transcription Factor IIE, Polypeptide 1, Alpha 56kDa (GTF2E1, Accession NM\_005513) is another VGAM739 host target gene. GTF2E1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GTF2E1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GTF2E1 BINDING SITE, designated SEQ ID:12039, to the nucleotide sequence of VGAM739 RNA, herein designated VGAM RNA, also designated SEQ ID:3450.

[29359] Another function of VGAM739 is therefore inhibition of General Transcription Factor IIE, Polypeptide 1, Alpha 56kDa (GTF2E1, Accession NM\_005513). Accordingly, utilities of VGAM739 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GTF2E1. KIAA0186 (Accession NM\_021067) is another VGAM739 host target gene. KIAA0186 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0186, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0186 BINDING SITE, designated SEQ ID:22041, to the nucleotide sequence of VGAM739 RNA, herein designated VGAM RNA, also designated SEQ ID:3450.

[29360] Another function of VGAM739 is therefore inhibition of KIAA0186 (Accession NM\_021067). Accordingly, utilities of VGAM739 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0186. KIAA1610 (Accession XM\_040622) is another VGAM739 host target gene. KIAA1610 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1610, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1610 BINDING SITE, designated SEQ ID:33343, to the nucleotide sequence of VGAM739 RNA, herein designated VGAM RNA, also designated SEQ ID:3450.

[29361] Another function of VGAM739 is therefore inhibition of KIAA1610 (Accession XM\_040622). Accordingly, utilities of VGAM739 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA1610. PRO2012 (Accession NM\_018614) is another VGAM739 host target gene. PRO2012 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO2012, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2012 BINDING SITE, designated SEQ ID:20683, to the nucleotide sequence of VGAM739 RNA, herein designated VGAM RNA, also designated SEQ ID:3450.

[29362] Another function of VGAM739 is therefore inhibition of PRO2012 (Accession NM\_018614). Accordingly, utilities of VGAM739 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2012. LOC145758 (Accession XM\_096858) is another VGAM739 host target gene. LOC145758 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145758, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145758 BINDING SITE, designated SEQ ID:40588, to the nucleotide se-

quence of VGAM739 RNA, herein designated VGAM RNA, also designated SEQ ID:3450.

[29363] Another function of VGAM739 is therefore inhibition of LOC145758 (Accession XM\_096858). Accordingly, utilities of VGAM739 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145758. LOC149506 (Accession XM\_097661) is another VGAM739 host target gene. LOC149506 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149506, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149506 BINDING SITE, designated SEQ ID:41011, to the nucleotide sequence of VGAM739 RNA, herein designated VGAM RNA, also designated SEQ ID:3450.

[29364] Another function of VGAM739 is therefore inhibition of LOC149506 (Accession XM\_097661). Accordingly, utilities of VGAM739 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149506. LOC158014 (Accession XM\_088442) is another VGAM739 host target gene. LOC158014 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC158014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158014 BINDING SITE, designated SEQ ID:39697, to the nucleotide sequence of VGAM739 RNA, herein designated VGAM RNA, also designated SEQ ID:3450.

[29365] Another function of VGAM739 is therefore inhibition of LOC158014 (Accession XM\_088442). Accordingly, utilities of VGAM739 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158014. LOC202316 (Accession XM\_117380) is another VGAM739 host target gene. LOC202316 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC202316, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202316 BINDING SITE, designated SEQ ID:43428, to the nucleotide sequence of VGAM739 RNA, herein designated VGAM RNA, also designated SEQ ID:3450.

[29366] Another function of VGAM739 is therefore inhibition of LOC202316 (Accession XM\_117380). Accordingly, utilities

of VGAM739 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202316. LOC254196 (Accession XM\_173220) is another VGAM739 host target gene. LOC254196 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC254196, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254196 BINDING SITE, designated SEQ ID:46478, to the nucleotide sequence of VGAM739 RNA, herein designated VGAM RNA, also designated SEQ ID:3450.

[29367] Another function of VGAM739 is therefore inhibition of LOC254196 (Accession XM\_173220). Accordingly, utilities of VGAM739 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254196. LOC90538 (Accession XM\_032401) is another VGAM739 host target gene. LOC90538 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90538, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC90538 BINDING SITE, designated SEQ ID:31661, to the nucleotide sequence of VGAM739 RNA, herein designated VGAM RNA, also designated SEQ ID:3450.

[29368] Another function of VGAM739 is therefore inhibition of LOC90538 (Accession XM\_032401). Accordingly, utilities of VGAM739 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90538. LOC91585 (Accession XM\_039395) is another VGAM739 host target gene. LOC91585 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91585, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91585 BINDING SITE, designated SEQ ID:33078, to the nucleotide sequence of VGAM739 RNA, herein designated VGAM RNA, also designated SEQ ID:3450.

[29369] Another function of VGAM739 is therefore inhibition of LOC91585 (Accession XM\_039395). Accordingly, utilities of VGAM739 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91585. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 740 (VGAM740) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29370] VGAM740 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM740 was detected is described hereinabove with reference to Figs. 1–8.

[29371] VGAM740 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Taura Syndrome Virus. VGAM740 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29372] VGAM740 gene encodes a VGAM740 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM740 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM740 precursor RNA is designated SEQ ID:726, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:726 is located at position 5382 relative to the genome of Taura

Syndrome Virus.

[29373] VGAM740 precursor RNA folds onto itself, forming VGAM740 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29374] An enzyme complex designated DICER COMPLEX, `dices` the VGAM740 folded precursor RNA into VGAM740 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM740 RNA is designated SEQ ID:3451, and is provided hereinbelow with reference to the sequence listing part.

[29375] VGAM740 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM740 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM740 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[29376] VGAM740 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM740 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM740 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM740 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM740 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[29377] The complementary binding of VGAM740 RNA, herein designated VGAM RNA, to host target binding sites on VGAM740 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM740 host target RNA into VGAM740 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29378] It is appreciated that VGAM740 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM740 host target genes. The mRNA of each one of this plurality of VGAM740 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM740 RNA, herein designated VGAM RNA, and which when bound by VGAM740 RNA causes inhibition of translation of respective one or more VGAM740 host target proteins.

[29379] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM740 gene, herein designated VGAM GENE, on one or more VGAM740 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[29380] It is yet further appreciated that a function of VGAM740 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM740 include diagnosis, prevention and treatment of viral infection by Taura Syndrome Virus. Specific functions, and accordingly utilities, of VGAM740 cor-

relate with, and may be deduced from, the identity of the host target genes which VGAM740 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29381] Nucleotide sequences of the VGAM740 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM740 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM740 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM740 are further described hereinbelow with reference to Table 1.

[29382] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM740 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM740 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29383] As mentioned hereinabove with reference to Fig. 1, a function of VGAM740 gene, herein designated VGAM is inhibition of expression of VGAM740 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM740 correlate with, and may be deduced

from, the identity of the target genes which VGAM740 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29384] FLJ13322 (Accession NM\_024722) is a VGAM740 host target gene. FLJ13322 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13322, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13322 BINDING SITE, designated SEQ ID:24057, to the nucleotide sequence of VGAM740 RNA, herein designated VGAM RNA, also designated SEQ ID:3451.

[29385] A function of VGAM740 is therefore inhibition of FLJ13322 (Accession NM\_024722). Accordingly, utilities of VGAM740 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13322. MGC9912 (Accession NM\_080664) is another VGAM740 host target gene. MGC9912 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC9912, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of MGC9912 BINDING SITE, designated SEQ ID:27950, to the nucleotide sequence of VGAM740 RNA, herein designated VGAM RNA, also designated SEQ ID:3451.

[29386] Another function of VGAM740 is therefore inhibition of MGC9912 (Accession NM\_080664). Accordingly, utilities of VGAM740 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC9912. Nuclear Transcription Factor, X-box Binding 1 (NFX1, Accession NM\_002504) is another VGAM740 host target gene. NFX1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NFX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NFX1 BINDING SITE, designated SEQ ID:8326, to the nucleotide sequence of VGAM740 RNA, herein designated VGAM RNA, also designated SEQ ID:3451.

[29387] Another function of VGAM740 is therefore inhibition of Nuclear Transcription Factor, X-box Binding 1 (NFX1, Accession NM\_002504). Accordingly, utilities of VGAM740 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with NFX1. Ribosomal Protein S6 Kinase, 90kDa, Polypeptide 4 (RPS6KA4, Accession NM\_003942) is another VGAM740 host target gene. RPS6KA4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RPS6KA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RPS6KA4 BINDING SITE, designated SEQ ID:10056, to the nucleotide sequence of VGAM740 RNA, herein designated VGAM RNA, also designated SEQ ID:3451.

[29388] Another function of VGAM740 is therefore inhibition of Ribosomal Protein S6 Kinase, 90kDa, Polypeptide 4 (RPS6KA4, Accession NM\_003942). Accordingly, utilities of VGAM740 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPS6KA4. LOC255027 (Accession XM\_170806) is another VGAM740 host target gene. LOC255027 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC255027, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of LOC255027 BINDING SITE, designated SEQ ID:45571, to the nucleotide sequence of VGAM740 RNA, herein designated VGAM RNA, also designated SEQ ID:3451.

[29389] Another function of VGAM740 is therefore inhibition of LOC255027 (Accession XM\_170806). Accordingly, utilities of VGAM740 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255027. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 741 (VGAM741) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29390] VGAM741 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM741 was detected is described hereinabove with reference to Figs. 1–8.

[29391] VGAM741 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Taura Syndrome Virus. VGAM741 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[29392] VGAM741 gene encodes a VGAM741 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM741 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM741 precursor RNA is designated SEQ ID:727, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:727 is located at position 2942 relative to the genome of Taura Syndrome Virus.

[29393] VGAM741 precursor RNA folds onto itself, forming VGAM741 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29394] An enzyme complex designated DICER COMPLEX, `dices` the VGAM741 folded precursor RNA into VGAM741 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM741 RNA is designated SEQ ID:3452, and is provided hereinbelow with reference to the sequence listing part.

[29395] VGAM741 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM741 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM741 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[29396] VGAM741 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM741 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM741 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM741 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM741 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[29397] The complementary binding of VGAM741 RNA, herein designated VGAM RNA, to host target binding sites on VGAM741 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM741 host target RNA into VGAM741 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29398] It is appreciated that VGAM741 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM741 host target genes. The mRNA of each one of this plurality of VGAM741 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM741 RNA, herein designated VGAM RNA, and which when bound by VGAM741 RNA causes inhibition of translation of respective one or more VGAM741 host target proteins.

[29399] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM741 gene, herein designated VGAM GENE, on one or more VGAM741 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[29400] It is yet further appreciated that a function of VGAM741 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM741 include diagnosis, prevention and treatment of viral infection by Taura Syndrome Virus. Specific functions, and accordingly utilities, of VGAM741 correlate with, and may be deduced from, the identity of the host target genes which VGAM741 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29401] Nucleotide sequences of the VGAM741 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM741 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM741 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM741 are further described hereinbelow with reference to Table 1.

[29402] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM741 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM741 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29403] As mentioned hereinabove with reference to Fig. 1, a function of VGAM741 gene, herein designated VGAM is inhibition of expression of VGAM741 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM741 correlate with, and may be deduced from, the identity of the target genes which VGAM741 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29404] Beta-site APP-cleaving Enzyme (BACE, Accession NM\_012104) is a VGAM741 host target gene. BACE BINDING SITE1 and BACE BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by BACE, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BACE BINDING SITE1 and BACE BINDING SITE2, designated SEQ ID:14415 and SEQ ID:29083 respectively, to the nucleotide sequence of

VGAM741 RNA, herein designated VGAM RNA, also designated SEQ ID:3452.

[29405] A function of VGAM741 is therefore inhibition of Beta-site APP-cleaving Enzyme (BACE, Accession NM\_012104), a gene which is responsible for the proteolytic processing of the amyloid precursor protein. Accordingly, utilities of VGAM741 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BACE. The function of BACE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM173.Smoothed Homolog (Drosophila) (SMOH, Accession NM\_005631) is another VGAM741 host target gene. SMOH BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SMOH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMOH BINDING SITE, designated SEQ ID:12162, to the nucleotide sequence of VGAM741 RNA, herein designated VGAM RNA, also designated SEQ ID:3452.

[29406] Another function of VGAM741 is therefore inhibition of

Smoothed Homolog (Drosophila) (SMOH, Accession NM\_005631). Accordingly, utilities of VGAM741 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMOH. HSA243666 (Accession NM\_017582) is another VGAM741 host target gene. HSA243666 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSA243666, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSA243666 BINDING SITE, designated SEQ ID:19018, to the nucleotide sequence of VGAM741 RNA, herein designated VGAM RNA, also designated SEQ ID:3452.

[29407] Another function of VGAM741 is therefore inhibition of HSA243666 (Accession NM\_017582). Accordingly, utilities of VGAM741 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSA243666. LHPP (Accession NM\_022126) is another VGAM741 host target gene. LHPP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LHPP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LHPP BINDING SITE, designated SEQ ID:22672, to the nucleotide sequence of VGAM741 RNA, herein designated VGAM RNA, also designated SEQ ID:3452.

[29408] Another function of VGAM741 is therefore inhibition of LHPP (Accession NM\_022126). Accordingly, utilities of VGAM741 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LHPP. RIP60 (Accession NM\_013400) is another VGAM741 host target gene. RIP60 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RIP60, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RIP60 BINDING SITE, designated SEQ ID:15058, to the nucleotide sequence of VGAM741 RNA, herein designated VGAM RNA, also designated SEQ ID:3452.

[29409] Another function of VGAM741 is therefore inhibition of RIP60 (Accession NM\_013400). Accordingly, utilities of VGAM741 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RIP60.

LOC123624 (Accession XM\_063761) is another VGAM741 host target gene. LOC123624 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC123624, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC123624 BINDING SITE, designated SEQ ID:37253, to the nucleotide sequence of VGAM741 RNA, herein designated VGAM RNA, also designated SEQ ID:3452.

[29410] Another function of VGAM741 is therefore inhibition of LOC123624 (Accession XM\_063761). Accordingly, utilities of VGAM741 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC123624. LOC131873 (Accession XM\_067585) is another VGAM741 host target gene. LOC131873 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC131873, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC131873 BINDING SITE, designated SEQ ID:37361, to the nucleotide sequence of VGAM741 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3452.

[29411] Another function of VGAM741 is therefore inhibition of LOC131873 (Accession XM\_067585). Accordingly, utilities of VGAM741 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC131873. LOC150174 (Accession XM\_086802) is another VGAM741 host target gene. LOC150174 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150174, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150174 BINDING SITE, designated SEQ ID:38869, to the nucleotide sequence of VGAM741 RNA, herein designated VGAM RNA, also designated SEQ ID:3452.

[29412] Another function of VGAM741 is therefore inhibition of LOC150174 (Accession XM\_086802). Accordingly, utilities of VGAM741 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150174. LOC151979 (Accession XM\_087354) is another VGAM741 host target gene. LOC151979 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151979, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151979 BINDING SITE, designated SEQ ID:39189, to the nucleotide sequence of VGAM741 RNA, herein designated VGAM RNA, also designated SEQ ID:3452.

[29413] Another function of VGAM741 is therefore inhibition of LOC151979 (Accession XM\_087354). Accordingly, utilities of VGAM741 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151979. LOC219397 (Accession XM\_167889) is another VGAM741 host target gene. LOC219397 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219397, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219397 BINDING SITE, designated SEQ ID:44898, to the nucleotide sequence of VGAM741 RNA, herein designated VGAM RNA, also designated SEQ ID:3452.

[29414] Another function of VGAM741 is therefore inhibition of LOC219397 (Accession XM\_167889). Accordingly, utilities of VGAM741 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC219397. LOC256158 (Accession XM\_175125) is another VGAM741 host target gene. LOC256158 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC256158, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256158 BINDING SITE, designated SEQ ID:46617, to the nucleotide sequence of VGAM741 RNA, herein designated VGAM RNA, also designated SEQ ID:3452.

[29415] Another function of VGAM741 is therefore inhibition of LOC256158 (Accession XM\_175125). Accordingly, utilities of VGAM741 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256158. LOC92223 (Accession XM\_043674) is another VGAM741 host target gene. LOC92223 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC92223, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92223 BINDING SITE, designated SEQ ID:33994, to the

nucleotide sequence of VGAM741 RNA, herein designated VGAM RNA, also designated SEQ ID:3452.

[29416] Another function of VGAM741 is therefore inhibition of LOC92223 (Accession XM\_043674). Accordingly, utilities of VGAM741 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92223. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 742 (VGAM742) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29417] VGAM742 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM742 was detected is described hereinabove with reference to Figs. 1–8.

[29418] VGAM742 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Taura Syndrome Virus. VGAM742 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29419] VGAM742 gene encodes a VGAM742 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM742 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM742 precursor RNA is designated SEQ ID:728, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:728 is located at position 1402 relative to the genome of Taura Syndrome Virus.

[29420] VGAM742 precursor RNA folds onto itself, forming VGAM742 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29421] An enzyme complex designated DICER COMPLEX, `dices` the VGAM742 folded precursor RNA into VGAM742 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM742 RNA is designated SEQ ID:3453, and is provided hereinbelow with reference to the sequence listing part.

[29422] VGAM742 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM742 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM742 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[29423] VGAM742 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM742 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM742 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM742 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM742 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[29424] The complementary binding of VGAM742 RNA, herein designated VGAM RNA, to host target binding sites on VGAM742 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM742 host target RNA into VGAM742 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29425] It is appreciated that VGAM742 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM742 host target genes. The mRNA of each one of this plurality of VGAM742 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM742 RNA, herein designated VGAM RNA, and which when bound by VGAM742 RNA causes inhibition of translation of respective one or more VGAM742 host target proteins.

[29426] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM742 gene, herein designated VGAM GENE, on one or more VGAM742 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[29427] It is yet further appreciated that a function of VGAM742 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM742 include diagnosis, prevention and treatment of viral infection by Taura Syndrome Virus. Specific functions, and accordingly utilities, of VGAM742 correlate with, and may be deduced from, the identity of the host target genes which VGAM742 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29428] Nucleotide sequences of the VGAM742 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM742 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM742 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM742 are further described hereinbelow with reference to Table 1.

[29429] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM742 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM742 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29430] As mentioned hereinabove with reference to Fig. 1, a function of VGAM742 gene, herein designated VGAM is inhibition of expression of VGAM742 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM742 correlate with, and may be deduced from, the identity of the target genes which VGAM742 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29431] BTB and CNC Homology 1, Basic Leucine Zipper Transcription Factor 2 (BACH2, Accession NM\_021813) is a VGAM742 host target gene. BACH2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BACH2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BACH2 BINDING SITE, designated SEQ ID:22377, to the nucleotide sequence of VGAM742 RNA, herein designated VGAM RNA, also designated SEQ ID:3453.

[29432] A function of VGAM742 is therefore inhibition of BTB and

CNC Homology 1, Basic Leucine Zipper Transcription Factor 2 (BACH2, Accession NM\_021813), a gene which acts as repressor or activator, binds to maf recognition elements. Accordingly, utilities of VGAM742 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BACH2. The function of BACH2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM331. Coronin, Actin Binding Protein, 1C (CORO1C, Accession NM\_014325) is another VGAM742 host target gene. CORO1C BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CORO1C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CORO1C BINDING SITE, designated SEQ ID:15629, to the nucleotide sequence of VGAM742 RNA, herein designated VGAM RNA, also designated SEQ ID:3453.

[29433] Another function of VGAM742 is therefore inhibition of Coronin, Actin Binding Protein, 1C (CORO1C, Accession NM\_014325). Accordingly, utilities of VGAM742 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with CORO1C. Deoxycytidine Kinase (DCK, Accession NM\_000788) is another VGAM742 host target gene. DCK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DCK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DCK BINDING SITE, designated SEQ ID:6444, to the nucleotide sequence of VGAM742 RNA, herein designated VGAM RNA, also designated SEQ ID:3453.

[29434] Another function of VGAM742 is therefore inhibition of Deoxycytidine Kinase (DCK, Accession NM\_000788), a gene which mediates the phosphorylation of several deoxyribonucleosides and their analogs. Accordingly, utilities of VGAM742 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DCK. The function of DCK and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM538. Secreted Frizzled-related Protein 1 (SFRP1, Accession NM\_003012) is another VGAM742 host target

gene. SFRP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SFRP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SFRP1 BINDING SITE, designated SEQ ID:8927, to the nucleotide sequence of VGAM742 RNA, herein designated VGAM RNA, also designated SEQ ID:3453.

[29435] Another function of VGAM742 is therefore inhibition of Secreted Frizzled-related Protein 1 (SFRP1, Accession NM\_003012), a gene which is a receptor for wnt proteins that may have an anti-apoptotic function. Accordingly, utilities of VGAM742 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFRP1. The function of SFRP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM250. Cell Adhesion Molecule with Homology to L1CAM (close homolog of L1) (CHL1, Accession NM\_006614) is another VGAM742 host target gene. CHL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CHL1, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHL1 BINDING SITE, designated SEQ ID:13396, to the nucleotide sequence of VGAM742 RNA, herein designated VGAM RNA, also designated SEQ ID:3453.

[29436] Another function of VGAM742 is therefore inhibition of Cell Adhesion Molecule with Homology to L1CAM (close homolog of L1) (CHL1, Accession NM\_006614). Accordingly, utilities of VGAM742 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHL1. CUB and Sushi Multiple Domains 1 (CSMD1, Accession XM\_054838) is another VGAM742 host target gene. CSMD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CSMD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CSMD1 BINDING SITE, designated SEQ ID:36185, to the nucleotide sequence of VGAM742 RNA, herein designated VGAM RNA, also designated SEQ ID:3453.

[29437] Another function of VGAM742 is therefore inhibition of

CUB and Sushi Multiple Domains 1 (CSMD1, Accession XM\_054838). Accordingly, utilities of VGAM742 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSMD1. Nudix (nucleoside diphosphate linked moiety X)-type Motif 11 (NUDT11, Accession XM\_010230) is another VGAM742 host target gene. NUDT11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NUDT11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NUDT11 BINDING SITE, designated SEQ ID:30140, to the nucleotide sequence of VGAM742 RNA, herein designated VGAM RNA, also designated SEQ ID:3453.

[29438] Another function of VGAM742 is therefore inhibition of Nudix (nucleoside diphosphate linked moiety X)-type Motif 11 (NUDT11, Accession XM\_010230). Accordingly, utilities of VGAM742 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUDT11. Phosphodiesterase 10A (PDE10A, Accession NM\_006661) is another VGAM742 host target gene. PDE10A BINDING SITE is HOST TARGET binding site found

in the 3` untranslated region of mRNA encoded by PDE10A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDE10A BINDING SITE, designated SEQ ID:13461, to the nucleotide sequence of VGAM742 RNA, herein designated VGAM RNA, also designated SEQ ID:3453.

[29439] Another function of VGAM742 is therefore inhibition of Phosphodiesterase 10A (PDE10A, Accession NM\_006661). Accordingly, utilities of VGAM742 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE10A. RAP140 (Accession NM\_015224) is another VGAM742 host target gene. RAP140 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RAP140, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAP140 BINDING SITE, designated SEQ ID:17553, to the nucleotide sequence of VGAM742 RNA, herein designated VGAM RNA, also designated SEQ ID:3453.

[29440] Another function of VGAM742 is therefore inhibition of

RAP140 (Accession NM\_015224). Accordingly, utilities of VGAM742 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAP140. LOC146488 (Accession XM\_047748) is another VGAM742 host target gene. LOC146488 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146488, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146488 BINDING SITE, designated SEQ ID:35040, to the nucleotide sequence of VGAM742 RNA, herein designated VGAM RNA, also designated SEQ ID:3453.

[29441] Another function of VGAM742 is therefore inhibition of LOC146488 (Accession XM\_047748). Accordingly, utilities of VGAM742 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146488. LOC162083 (Accession XM\_091339) is another VGAM742 host target gene. LOC162083 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC162083, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC162083 BINDING SITE, designated SEQ ID:40046, to the nucleotide sequence of VGAM742 RNA, herein designated VGAM RNA, also designated SEQ ID:3453.

[29442] Another function of VGAM742 is therefore inhibition of LOC162083 (Accession XM\_091339). Accordingly, utilities of VGAM742 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC162083. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 743 (VGAM743) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29443] VGAM743 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM743 was detected is described hereinabove with reference to Figs. 1–8.

[29444] VGAM743 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Invertebrate Iridescent Virus 6. VGAM743 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in

the human genome.

[29445] VGAM743 gene encodes a VGAM743 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM743 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM743 precursor RNA is designated SEQ ID:729, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:729 is located at position 189563 relative to the genome of Invertebrate Iridescent Virus 6.

[29446] VGAM743 precursor RNA folds onto itself, forming VGAM743 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29447] An enzyme complex designated DICER COMPLEX, `dices` the VGAM743 folded precursor RNA into VGAM743 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM743 RNA is designated SEQ ID:3454, and is provided hereinbelow with reference to the sequence listing part.

[29448] VGAM743 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM743 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM743 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[29449] VGAM743 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM743 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM743 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM743 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM743 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[29450] The complementary binding of VGAM743 RNA, herein designated VGAM RNA, to host target binding sites on VGAM743 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM743 host target RNA into VGAM743 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29451] It is appreciated that VGAM743 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM743 host target genes. The mRNA of each one of this plurality of VGAM743 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM743 RNA, herein designated VGAM RNA, and which when bound by VGAM743 RNA causes inhibition of translation of respective one or more VGAM743 host target proteins.

[29452] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM743 gene, herein designated VGAM GENE, on one or more VGAM743 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[29453] It is yet further appreciated that a function of VGAM743 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM743 include diagnosis, prevention and treatment of viral infection by Invertebrate Iridescent Virus 6. Specific functions, and accordingly utilities, of VGAM743 correlate with, and may be deduced from, the identity of the host target genes which VGAM743 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29454] Nucleotide sequences of the VGAM743 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM743 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM743 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM743 are further described hereinbelow with reference to Table 1.

[29455] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM743 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM743 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29456] As mentioned hereinabove with reference to Fig. 1, a function of VGAM743 gene, herein designated VGAM is inhibition of expression of VGAM743 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM743 correlate with, and may be deduced from, the identity of the target genes which VGAM743 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29457] COX15 Homolog, Cytochrome C Oxidase Assembly Protein (yeast) (COX15, Accession NM\_078470) is a VGAM743 host target gene. COX15 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by COX15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COX15 BINDING SITE, designated SEQ ID:27788, to the nucleotide sequence of VGAM743 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:3454.

[29458] A function of VGAM743 is therefore inhibition of COX15 Homolog, Cytochrome C Oxidase Assembly Protein (yeast) (COX15, Accession NM\_078470). Accordingly, utilities of VGAM743 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COX15. Cysteine and Glycine-rich Protein 1 (CSRP1, Accession NM\_004078) is another VGAM743 host target gene. CSRP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CSRP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CSRP1 BINDING SITE, designated SEQ ID:10278, to the nucleotide sequence of VGAM743 RNA, herein designated VGAM RNA, also designated SEQ ID:3454.

[29459] Another function of VGAM743 is therefore inhibition of Cysteine and Glycine-rich Protein 1 (CSRP1, Accession NM\_004078), a gene which could play a role in neuronal development. Accordingly, utilities of VGAM743 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSRP1. The function of CSRP1 has been established by previous studies. The hu-

man gene encoding cysteine-rich protein (CSRP) is a highly conserved, cell cycle-regulated gene that is induced in the immediate early response to serum repletion in serum-starved, noncycling cells. The LIM/double zinc finger motif found in cysteine-rich protein is found in an expanding group of proteins with critical functions in gene regulation, cell growth, and somatic differentiation (Wang et al., 1992). Other members of the group include cysteine-rich intestinal protein (CRIP; 123875), CSRP2 (OMIM Ref. No. 601871), CSRP3 (OMIM Ref. No. 600824), and the rhombotin genes RBTN1 (OMIM Ref. No. 186921), RBTN2 (OMIM Ref. No. 180385), and RBTN3 (OMIM Ref. No. 180386). Weiskirchen et al. (1995) described the CRP family of LIM domain proteins Wang et al. (1992) cloned the human CRP genomic sequence. The CRP gene spans approximately 23.2 kb from the cap site to the polyadenylation site. It contains 6 exons, with a 10.4-kb first intron. The authors showed that CRP is a primary response gene in both human fibroblasts and mouse Balb/c 3T3 cells; in the mouse cells, the kinetic profile of its induction closely paralleled that of c-myc (190080

[29460] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[29461] Wang, X.; Ray, K.; Szpirer, J.; Levan, G.; Liebhaber, S. A.; Cooke, N. E. : Analysis of the human cysteine-rich protein gene (CSRP), assignment to chromosome 1q24-1q32, and identification of an associated MspI polymorphism. *Genomics* 14: 391-397, 1992. ; and

[29462] Liebhaber, S. A.; Emery, J. G.; Urbanek, M.; Wang, X.; Cooke, N. E. : Characterization of a human cDNA encoding a widely expressed and highly conserved cysteine-rich protein with an unus.

[29463] Further studies establishing the function and utilities of CSRP1 are found in John Hopkins OMIM database record ID 123876, and in cited publications numbered 3977-3979, 3982-398 and 3980 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Exostoses (multiple)-like 2 (EXTL2, Accession NM\_001439) is another VGAM743 host target gene. EXTL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EXTL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EXTL2 BINDING SITE, designated SEQ

ID:7163, to the nucleotide sequence of VGAM743 RNA, herein designated VGAM RNA, also designated SEQ ID:3454.

[29464] Another function of VGAM743 is therefore inhibition of Exostoses (multiple)-like 2 (EXTL2, Accession NM\_001439), a gene which is homologous to the EXT and EXTL genes. Accordingly, utilities of VGAM743 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EXTL2. The function of EXTL2 has been established by previous studies. In patients with multiple exostoses, mutations in 2 different genes have been found: EXT1 (OMIM Ref. No. 133700) on 8q and EXT2 (OMIM Ref. No. 133701) on 11p. In addition, linkage has demonstrated a third locus, EXT3 (OMIM Ref. No. 600209), on 19p as the site of mutations causing multiple exostoses. The family of EXT genes was extended by the identification of an EXT-like gene (EXTL1; 601738) showing a high degree of homology with the EXT genes. Wuyts et al. (1997) described a second EXT-like gene, EXTL2, that is homologous to the EXT and EXTL genes. EXTL2 was found to consist of 5 exons encoding a ubiquitously expressed 330-amino acid protein. In addition, a putative pseudogene, EXTL2P, was identified. Saito et al. (1998)

also cloned an EXTL2 cDNA, which they called EXTR2. By Northern blot analysis, they detected a 3.4-kb transcript in all tissues tested except leukocyte, where the gene was hardly transcribed. Its expression was relatively constant among tissues, but was weak in liver, lung, and thymus. By fluorescence in situ hybridization, Wuyts et al. (1997) mapped the EXTL2 gene to 1p12-p11 and the EXTL2 pseudogene to 2q24-q31. By somatic cell hybrid and radiation hybrid analyses, Saito et al. (1998) mapped the EXTL2 gene to chromosome 1p21. Wuyts and Van Hul (2000) cloned mouse Extl2, which has the same genomic structure as the human gene, encodes a protein identical in size, and has a sequence that is 87% identical to the human sequence. By radiation hybrid analysis, they mapped the mouse gene to chromosome 3.

[29465] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[29466] Wuyts, W.; Van Hul, W.; Hendrickx, J.; Speleman, F.; Wauters, J.; De Boulle, K.; Van Roy, N.; Van Agtmael, T.; Bossuyt, P.; Willems, P. J. : Identification and characterization of a novel member of the EXT gene family, EXTL2. *Eur. J. Hum. Genet.* 5: 382-389, 1997. ; and

[29467] Wuyts, W.; Van Hul, W. : Characterization and genomic localization of the mouse Extl2 gene. Cytogenet. Cell Genet. 89: 185–188, 2000.

[29468] Further studies establishing the function and utilities of EXTL2 are found in John Hopkins OMIM database record ID 602411, and in cited publications numbered 6016–6018 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Sparc/osteonectin, Cwcv and Kazal-like Domains Proteoglycan (testican) (SPOCK, Accession XM\_031696) is another VGAM743 host target gene. SPOCK BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SPOCK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPOCK BINDING SITE, designated SEQ ID:31457, to the nucleotide sequence of VGAM743 RNA, herein designated VGAM RNA, also designated SEQ ID:3454.

[29469] Another function of VGAM743 is therefore inhibition of Sparc/osteonectin, Cwcv and Kazal-like Domains Proteoglycan (testican) (SPOCK, Accession XM\_031696). Accordingly, utilities of VGAM743 include diagnosis, prevention

and treatment of diseases and clinical conditions associated with SPOCK. Bromodomain Containing 2 (BRD2, Accession NM\_005104) is another VGAM743 host target gene. BRD2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by BRD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BRD2 BINDING SITE, designated SEQ ID:11575, to the nucleotide sequence of VGAM743 RNA, herein designated VGAM RNA, also designated SEQ ID:3454.

[29470] Another function of VGAM743 is therefore inhibition of Bromodomain Containing 2 (BRD2, Accession NM\_005104). Accordingly, utilities of VGAM743 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BRD2. FLJ12747 (Accession NM\_032173) is another VGAM743 host target gene. FLJ12747 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12747, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12747 BINDING SITE, designated SEQ

ID:25880, to the nucleotide sequence of VGAM743 RNA, herein designated VGAM RNA, also designated SEQ ID:3454.

[29471] Another function of VGAM743 is therefore inhibition of FLJ12747 (Accession NM\_032173). Accordingly, utilities of VGAM743 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12747. Glutamate Receptor, Ionotropic, N-methyl-D-aspartate 3A (GRIN3A, Accession NM\_133445) is another VGAM743 host target gene. GRIN3A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GRIN3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRIN3A BINDING SITE, designated SEQ ID:28540, to the nucleotide sequence of VGAM743 RNA, herein designated VGAM RNA, also designated SEQ ID:3454.

[29472] Another function of VGAM743 is therefore inhibition of Glutamate Receptor, Ionotropic, N-methyl-D-aspartate 3A (GRIN3A, Accession NM\_133445). Accordingly, utilities of VGAM743 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRIN3A.

HSPC054 (Accession NM\_014152) is another VGAM743 host target gene. HSPC054 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSPC054, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPC054 BINDING SITE, designated SEQ ID:15434, to the nucleotide sequence of VGAM743 RNA, herein designated VGAM RNA, also designated SEQ ID:3454.

[29473] Another function of VGAM743 is therefore inhibition of HSPC054 (Accession NM\_014152). Accordingly, utilities of VGAM743 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC054. KIAA0016 (Accession NM\_014765) is another VGAM743 host target gene. KIAA0016 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0016, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0016 BINDING SITE, designated SEQ ID:16534, to the nucleotide sequence of VGAM743 RNA, herein designated VGAM RNA, also design-

nated SEQ ID:3454.

[29474] Another function of VGAM743 is therefore inhibition of KIAA0016 (Accession NM\_014765). Accordingly, utilities of VGAM743 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0016. P311 (Accession NM\_004772) is another VGAM743 host target gene. P311 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by P311, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P311 BINDING SITE, designated SEQ ID:11163, to the nucleotide sequence of VGAM743 RNA, herein designated VGAM RNA, also designated SEQ ID:3454.

[29475] Another function of VGAM743 is therefore inhibition of P311 (Accession NM\_004772). Accordingly, utilities of VGAM743 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P311. PA26 (Accession NM\_014454) is another VGAM743 host target gene. PA26 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PA26, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PA26 BINDING SITE, designated SEQ ID:15807, to the nucleotide sequence of VGAM743 RNA, herein designated VGAM RNA, also designated SEQ ID:3454.

[29476] Another function of VGAM743 is therefore inhibition of PA26 (Accession NM\_014454). Accordingly, utilities of VGAM743 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PA26. Sideroflexin 5 (SFXN5, Accession NM\_144579) is another VGAM743 host target gene. SFXN5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SFXN5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SFXN5 BINDING SITE, designated SEQ ID:29386, to the nucleotide sequence of VGAM743 RNA, herein designated VGAM RNA, also designated SEQ ID:3454.

[29477] Another function of VGAM743 is therefore inhibition of Sideroflexin 5 (SFXN5, Accession NM\_144579). Accordingly, utilities of VGAM743 include diagnosis, prevention

and treatment of diseases and clinical conditions associated with SFXN5. LOC196027 (Accession XM\_113633) is another VGAM743 host target gene. LOC196027 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196027, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196027 BINDING SITE, designated SEQ ID:42305, to the nucleotide sequence of VGAM743 RNA, herein designated VGAM RNA, also designated SEQ ID:3454.

[29478] Another function of VGAM743 is therefore inhibition of LOC196027 (Accession XM\_113633). Accordingly, utilities of VGAM743 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196027. LOC81034 (Accession NM\_030780) is another VGAM743 host target gene. LOC81034 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC81034, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC81034 BINDING SITE, designated SEQ ID:25070, to the

nucleotide sequence of VGAM743 RNA, herein designated VGAM RNA, also designated SEQ ID:3454.

[29479] Another function of VGAM743 is therefore inhibition of LOC81034 (Accession NM\_030780). Accordingly, utilities of VGAM743 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC81034. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 744 (VGAM744) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29480] VGAM744 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM744 was detected is described hereinabove with reference to Figs. 1–8.

[29481] VGAM744 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Coronavirus. VGAM744 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29482] VGAM744 gene encodes a VGAM744 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM744 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM744 precursor RNA is designated SEQ ID:730, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:730 is located at position 1346 relative to the genome of Bovine Coronavirus.

[29483] VGAM744 precursor RNA folds onto itself, forming VGAM744 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29484] An enzyme complex designated DICER COMPLEX, `dices` the VGAM744 folded precursor RNA into VGAM744 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM744 RNA is designated SEQ ID:3455, and is provided hereinbelow with reference to the sequence listing part.

[29485] VGAM744 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM744 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM744 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[29486] VGAM744 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM744 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM744 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM744 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM744 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[29487] The complementary binding of VGAM744 RNA, herein designated VGAM RNA, to host target binding sites on VGAM744 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM744 host target RNA into VGAM744 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29488] It is appreciated that VGAM744 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM744 host target genes. The mRNA of each one of this plurality of VGAM744 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM744 RNA, herein designated VGAM RNA, and which when bound by VGAM744 RNA causes inhibition of translation of respective one or more VGAM744 host target proteins.

[29489] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM744 gene, herein designated VGAM GENE, on one or more VGAM744 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[29490] It is yet further appreciated that a function of VGAM744 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM744 include diagnosis, prevention and treatment of viral infection by Bovine Coronavirus. Specific functions, and accordingly utilities, of VGAM744 correlate with, and may be deduced from, the identity of the host target genes which VGAM744 binds and inhibits, and the function of these host target genes, as elaborated herein–below.

[29491] Nucleotide sequences of the VGAM744 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM744 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM744 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM744 are further described hereinbelow with reference to Table 1.

[29492] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM744 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM744 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29493] As mentioned hereinabove with reference to Fig. 1, a function of VGAM744 gene, herein designated VGAM is inhibition of expression of VGAM744 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM744 correlate with, and may be deduced from, the identity of the target genes which VGAM744 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29494] Tropomyosin 4 (TPM4, Accession NM\_003290) is a VGAM744 host target gene. TPM4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TPM4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TPM4 BINDING SITE, designated SEQ ID:9299, to the nucleotide sequence of VGAM744 RNA, herein designated VGAM RNA, also designated SEQ ID:3455.

[29495] A function of VGAM744 is therefore inhibition of Tropomyosin 4 (TPM4, Accession NM\_003290), a gene

which plays a central role, in association with the troponin complex, in the calcium dependent regulation of vertebrate striated muscle contraction. Accordingly, utilities of VGAM744 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TPM4. The function of TPM4 has been established by previous studies. Vertebrates have at least 4 different tropomyosin genes; in humans, they are named TPM1 (OMIM Ref. No. 191010), TPM2 (OMIM Ref. No. 190990), TPM3 (OMIM Ref. No. 191030), and TPM4. Both the muscle and nonmuscle isoforms of the tropomyosins are expressed through alternative splicing of each of the 4 genes. Laing et al. (1995) referred to unpublished observations indicating that the TPM4 gene maps to human chromosome 19. Wilton et al. (1996) developed sequence tagged sites (STS) for the TPM4 gene. One STS was used to amplify DNA from somatic cell hybrids to localize TPM4 to chromosome 19. The other, a product from a long-range PCR, was used directly as a probe to refine the localization of TPM4 to 19p13.1 by fluorescence in situ hybridization to metaphase chromosome spreads.

[29496] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [29497] Laing, N. G.; Wilton, S. D.; Akkari, P. A.; Dorosz, S.; Boundy, K.; Kneebone, C.; Blumbergs, P.; White, S.; Watkins, H.; Love, D. R.; Haan, E. : A mutation in the alpha tropomyosin gene TPM3 associated with autosomal dominant nemaline myopathy. *Nature Genet.* 9: 75–79, 1995. ; and
- [29498] Wilton, S. D.; Lim, L.; Dorosz, S. D.; Gunn, H. C.; Eyre, H. J.; Callen, D. F.; Laing, N. G. : Assignment of the human alpha-tropomyosin gene TPM4 to band 19p13.1 by fluorescence in situ hy.
- [29499] Further studies establishing the function and utilities of TPM4 are found in John Hopkins OMIM database record ID 600317, and in cited publications numbered 300 and 7225 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Zinc Finger Protein 135 (clone pHZ-17) (ZNF135, Accession NM\_003436) is another VGAM744 host target gene. ZNF135 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF135, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

ZNF135 BINDING SITE, designated SEQ ID:9488, to the nucleotide sequence of VGAM744 RNA, herein designated VGAM RNA, also designated SEQ ID:3455.

[29500] Another function of VGAM744 is therefore inhibition of Zinc Finger Protein 135 (clone pHZ-17) (ZNF135, Accession NM\_003436). Accordingly, utilities of VGAM744 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF135. DKFZp434C0923 (Accession NM\_017598) is another VGAM744 host target gene. DKFZp434C0923 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZp434C0923, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434C0923 BINDING SITE, designated SEQ ID:19060, to the nucleotide sequence of VGAM744 RNA, herein designated VGAM RNA, also designated SEQ ID:3455.

[29501] Another function of VGAM744 is therefore inhibition of DKFZp434C0923 (Accession NM\_017598). Accordingly, utilities of VGAM744 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with DKFZp434C0923. DKFZp566H0824 (Accession NM\_017535) is another VGAM744 host target gene. DKFZp566H0824 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZp566H0824, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp566H0824 BINDING SITE, designated SEQ ID:18972, to the nucleotide sequence of VGAM744 RNA, herein designated VGAM RNA, also designated SEQ ID:3455.

[29502] Another function of VGAM744 is therefore inhibition of DKFZp566H0824 (Accession NM\_017535). Accordingly, utilities of VGAM744 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp566H0824. LOC152106 (Accession XM\_046399) is another VGAM744 host target gene. LOC152106 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152106, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152106 BINDING SITE, desig-

nated SEQ ID:34708, to the nucleotide sequence of VGAM744 RNA, herein designated VGAM RNA, also designated SEQ ID:3455.

[29503] Another function of VGAM744 is therefore inhibition of LOC152106 (Accession XM\_046399). Accordingly, utilities of VGAM744 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152106. LOC255152 (Accession XM\_173310) is another VGAM744 host target gene. LOC255152 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255152, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255152 BINDING SITE, designated SEQ ID:46533, to the nucleotide sequence of VGAM744 RNA, herein designated VGAM RNA, also designated SEQ ID:3455.

[29504] Another function of VGAM744 is therefore inhibition of LOC255152 (Accession XM\_173310). Accordingly, utilities of VGAM744 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255152. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 745 (VGAM745) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29505] VGAM745 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM745 was detected is described hereinabove with reference to Figs. 1–8.

[29506] VGAM745 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Coronavirus. VGAM745 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29507] VGAM745 gene encodes a VGAM745 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM745 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM745 precursor RNA is designated SEQ ID:731, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:731 is located at position 18815 relative to the genome of

## Bovine Coronavirus.

[29508] VGAM745 precursor RNA folds onto itself, forming VGAM745 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29509] An enzyme complex designated DICER COMPLEX, `dices` the VGAM745 folded precursor RNA into VGAM745 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM745 RNA is designated SEQ ID:3456, and is provided hereinbelow with reference to the sequence listing part.

[29510] VGAM745 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM745 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM745 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[29511] VGAM745 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM745 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM745 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM745 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM745 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[29512] The complementary binding of VGAM745 RNA, herein designated VGAM RNA, to host target binding sites on VGAM745 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM745 host target RNA into VGAM745 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29513] It is appreciated that VGAM745 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM745 host target genes. The mRNA of each one of this plurality of VGAM745 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM745 RNA, herein designated VGAM RNA, and which when bound by VGAM745 RNA causes inhibition of translation of respective one or more VGAM745 host target proteins.

[29514] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM745 gene, herein designated VGAM GENE, on one or more VGAM745 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[29515] It is yet further appreciated that a function of VGAM745 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM745 include diagnosis, prevention and treatment of viral infection by Bovine Coronavirus. Specific functions, and accordingly utilities, of VGAM745 correlate

with, and may be deduced from, the identity of the host target genes which VGAM745 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29516] Nucleotide sequences of the VGAM745 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM745 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM745 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM745 are further described hereinbelow with reference to Table 1.

[29517] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM745 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM745 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29518] As mentioned hereinabove with reference to Fig. 1, a function of VGAM745 gene, herein designated VGAM is inhibition of expression of VGAM745 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM745 correlate with, and may be deduced

from, the identity of the target genes which VGAM745 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29519] ATP-binding Cassette, Sub-family C (CFTR/MRP), Member 1 (ABCC1, Accession NM\_019900) is a VGAM745 host target gene. ABCC1 BINDING SITE1 through ABCC1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ABCC1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCC1 BINDING SITE1 through ABCC1 BINDING SITE3, designated SEQ ID:21283, SEQ ID:21287 and SEQ ID:11439 respectively, to the nucleotide sequence of VGAM745 RNA, herein designated VGAM RNA, also designated SEQ ID:3456.

[29520] A function of VGAM745 is therefore inhibition of ATP-binding Cassette, Sub-family C (CFTR/MRP), Member 1 (ABCC1, Accession NM\_019900), a gene which may participate directly in the active transport of drugs into sub-cellular organelles or influence drug distribution indirectly. Accordingly, utilities of VGAM745 include diagnosis, prevention and treatment of diseases and clinical con-

ditions associated with ABCC1. The function of ABCC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM479. Chloride Intracellular Channel 4 (CLIC4, Accession NM\_013943) is another VGAM745 host target gene. CLIC4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLIC4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLIC4 BINDING SITE, designated SEQ ID:15131, to the nucleotide sequence of VGAM745 RNA, herein designated VGAM RNA, also designated SEQ ID:3456.

[29521] Another function of VGAM745 is therefore inhibition of Chloride Intracellular Channel 4 (CLIC4, Accession NM\_013943). Accordingly, utilities of VGAM745 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLIC4. FLJ13194 (Accession NM\_025146) is another VGAM745 host target gene. FLJ13194 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13194, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13194 BINDING SITE, designated SEQ ID:24786, to the nucleotide sequence of VGAM745 RNA, herein designated VGAM RNA, also designated SEQ ID:3456.

[29522] Another function of VGAM745 is therefore inhibition of FLJ13194 (Accession NM\_025146). Accordingly, utilities of VGAM745 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13194. KIAA1753 (Accession XM\_036115) is another VGAM745 host target gene. KIAA1753 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1753, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1753 BINDING SITE, designated SEQ ID:32383, to the nucleotide sequence of VGAM745 RNA, herein designated VGAM RNA, also designated SEQ ID:3456.

[29523] Another function of VGAM745 is therefore inhibition of KIAA1753 (Accession XM\_036115). Accordingly, utilities of VGAM745 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA1753. Kelch-like 4 (Drosophila) (KLHL4, Accession NM\_019117) is another VGAM745 host target gene. KLHL4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KLHL4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLHL4 BINDING SITE, designated SEQ ID:21196, to the nucleotide sequence of VGAM745 RNA, herein designated VGAM RNA, also designated SEQ ID:3456.

[29524] Another function of VGAM745 is therefore inhibition of Kelch-like 4 (Drosophila) (KLHL4, Accession NM\_019117). Accordingly, utilities of VGAM745 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLHL4. LOC200609 (Accession XM\_117256) is another VGAM745 host target gene. LOC200609 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200609, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of LOC200609 BINDING SITE, designated SEQ ID:43330, to the nucleotide sequence of VGAM745 RNA, herein designated VGAM RNA, also designated SEQ ID:3456.

[29525] Another function of VGAM745 is therefore inhibition of LOC200609 (Accession XM\_117256). Accordingly, utilities of VGAM745 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200609. LOC220980 (Accession XM\_167629) is another VGAM745 host target gene. LOC220980 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220980, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220980 BINDING SITE, designated SEQ ID:44739, to the nucleotide sequence of VGAM745 RNA, herein designated VGAM RNA, also designated SEQ ID:3456.

[29526] Another function of VGAM745 is therefore inhibition of LOC220980 (Accession XM\_167629). Accordingly, utilities of VGAM745 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220980. LOC254556 (Accession XM\_170588) is an-

other VGAM745 host target gene. LOC254556 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254556, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254556 BINDING SITE, designated SEQ ID:45394, to the nucleotide sequence of VGAM745 RNA, herein designated VGAM RNA, also designated SEQ ID:3456.

[29527] Another function of VGAM745 is therefore inhibition of LOC254556 (Accession XM\_170588). Accordingly, utilities of VGAM745 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254556. LOC93538 (Accession XM\_051927) is another VGAM745 host target gene. LOC93538 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC93538, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93538 BINDING SITE, designated SEQ ID:35922, to the nucleotide sequence of VGAM745 RNA, herein designated VGAM RNA, also designated SEQ ID:3456.

[29528] Another function of VGAM745 is therefore inhibition of LOC93538 (Accession XM\_051927). Accordingly, utilities of VGAM745 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93538. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 746 (VGAM746) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29529] VGAM746 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM746 was detected is described hereinabove with reference to Figs. 1–8.

[29530] VGAM746 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Coronavirus. VGAM746 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29531] VGAM746 gene encodes a VGAM746 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM746

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM746 precursor RNA is designated SEQ ID:732, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:732 is located at position 13256 relative to the genome of Bovine Coronavirus.

[29532] VGAM746 precursor RNA folds onto itself, forming VGAM746 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29533] An enzyme complex designated DICER COMPLEX, `dices` the VGAM746 folded precursor RNA into VGAM746 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 45%) nucleotide sequence of VGAM746 RNA is designated SEQ ID:3457, and is provided hereinbelow with reference to the sequence listing part.

[29534] VGAM746 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM746 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM746 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[29535] VGAM746 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM746 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM746 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM746 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM746 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[29536] The complementary binding of VGAM746 RNA, herein designated VGAM RNA, to host target binding sites on VGAM746 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM746 host target RNA into VGAM746 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29537] It is appreciated that VGAM746 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM746 host target genes. The mRNA of each one of this plurality of VGAM746 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM746 RNA, herein designated VGAM RNA, and which when bound by VGAM746 RNA causes inhibition of translation of respective one or more VGAM746 host target proteins.

[29538] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM746 gene, herein designated VGAM GENE, on one or more VGAM746 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[29539] It is yet further appreciated that a function of VGAM746 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM746 include diagnosis, prevention and treatment of viral infection by Bovine Coronavirus. Specific functions, and accordingly utilities, of VGAM746 correlate with, and may be deduced from, the identity of the host target genes which VGAM746 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29540] Nucleotide sequences of the VGAM746 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM746 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM746 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM746 are further described hereinbelow with reference to Table 1.

[29541] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM746 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM746 RNA, herein designated VGAM RNA, are described hereinbelow with refer-

ence to Table 2.

[29542] As mentioned hereinabove with reference to Fig. 1, a function of VGAM746 gene, herein designated VGAM is inhibition of expression of VGAM746 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM746 correlate with, and may be deduced from, the identity of the target genes which VGAM746 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29543] Glutamate Receptor, Metabotropic 7 (GRM7, Accession NM\_000844) is a VGAM746 host target gene. GRM7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GRM7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRM7 BINDING SITE, designated SEQ ID:6518, to the nucleotide sequence of VGAM746 RNA, herein designated VGAM RNA, also designated SEQ ID:3457.

[29544] A function of VGAM746 is therefore inhibition of Glutamate Receptor, Metabotropic 7 (GRM7, Accession NM\_000844), a gene which is mediated by a g-protein that inhibits adenylate cyclase activity. Accordingly, utili-

ties of VGAM746 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRM7. The function of GRM7 has been established by previous studies. L-glutamate, a major excitatory neurotransmitter, interacts with both ionotropic and metabotropic glutamate receptors. See mGluR3 (OMIM Ref. No. 601115). The metabotropic glutamate receptors (OMIM Ref. No. mGluRs), which are G protein-coupled receptors, have been divided into 3 groups on the basis of sequence homology, putative signal transduction mechanisms, and pharmacologic properties. Group II and group III mGluRs are linked to the inhibition of the cyclic AMP cascade, but differ in their agonist selectivities. Okamoto et al. (1994) isolated cDNAs encoding rat mGluR7. The predicted mGluR7 protein shares the structural profile of other mGluRs, with a signal peptide and a large extracellular domain followed by 7 membrane-spanning domains. This receptor shows a high degree of similarity to the group III receptors mGluR4 (OMIM Ref. No. 604100) and mGluR6 (OMIM Ref. No. 604096) in terms of both amino acid sequence and agonist selectivity. In situ hybridization to rat brain tissues indicated that the mGluR7 gene is expressed widely, unlike mGluR4 and mGluR6. Wu et al.

(1998) and Makoff et al. (1996) isolated human brain cDNAs encoding mGluR7. They both reported that the predicted 915-amino acid human protein is 99% identical to rat mGluR7. Wu et al. (1998) stated that the group III human receptors, mGluR7, mGluR4, and mGluR8 (OMIM Ref. No. 601116), share 67 to 70% protein sequence similarity with each other and 42 to 45% similarity with the group I and group II receptors. Using in situ hybridization, Makoff et al. (1996) determined that mGluR7 is expressed in many areas of the human brain, especially in the cerebral cortex, hippocampus, and cerebellum.

[29545] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[29546] Okamoto, N.; Hori, S.; Akazawa, C.; Hayashi, Y.; Shigemoto, R.; Mizuno, N.; Nakanishi, S. : Molecular characterization of a new metabotropic glutamate receptor mGluR7 coupled to inhibitory cyclic AMP signal transduction. J. Biol. Chem. 269: 1231-1236, 1994. ; and

[29547] Wu, S.; Wright, R. A.; Rockey, P. K.; Burgett, S. G.; Arnold, J. S.; Rosteck, P. R., Jr.; Johnson, B. G.; Schoepp, D. D.; Belagaje, R. M. : Group III human metabotropic glutamate recept.

[29548] Further studies establishing the function and utilities of GRM7 are found in John Hopkins OMIM database record ID 604101, and in cited publications numbered 504 and 7055 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Mannosyl (alpha-1,6-)-glycoprotein Beta-1,6-N-acetyl-glucosaminyltransferase (MGAT5, Accession NM\_002410) is another VGAM746 host target gene. MGAT5 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGAT5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGAT5 BINDING SITE, designated SEQ ID:8240, to the nucleotide sequence of VGAM746 RNA, herein designated VGAM RNA, also designated SEQ ID:3457.

[29549] Another function of VGAM746 is therefore inhibition of Mannosyl (alpha-1,6-)-glycoprotein Beta-1,6-N-acetyl-glucosaminyltransferase (MGAT5, Accession NM\_002410). Accordingly, utilities of VGAM746 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGAT5. X-box Binding Pro-

tein 1 (XBP1, Accession NM\_005080) is another VGAM746 host target gene. XBP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by XBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of XBP1 BINDING SITE, designated SEQ ID:11533, to the nucleotide sequence of VGAM746 RNA, herein designated VGAM RNA, also designated SEQ ID:3457.

[29550] Another function of VGAM746 is therefore inhibition of X-box Binding Protein 1 (XBP1, Accession NM\_005080), a gene which has a role in transcriptional regulation. Accordingly, utilities of VGAM746 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XBP1. The function of XBP1 has been established by previous studies. The class II major histocompatibility complex antigens are a family of integral membrane proteins whose expression is tissue-specific and developmentally regulated. Three consensus sequences, X1, X2, and Y, separated by an interspace element, are found upstream from all class II genes. Deletion of each of these sequences eliminates expression of class II genes in

vitro and in transgenic mice. Liou et al. (1990) isolated a cDNA encoding a DNA-binding protein whose target is the X boxes of DR-alpha and DP-beta. Liou et al. (1991) found that the protein, which they referred to as XBP1, acts as a transcription factor in B cells by recognizing both the X2 promoter element of both the human DR-alpha and DP-beta and mouse A-alpha genes. The cDNA for the XBP1 gene hybridized to human RNA species of approximately 2.2 kb and 2.6 kb, which were expressed in class II negative as well as class II positive cells. By in situ hybridization analysis, Reimold et al. (2001) demonstrated that XBP1 was expressed at high levels in plasma cells in rheumatoid synovium from 2 patients. By analysis of interspecies somatic cell hybrids, Liou et al. (1991) demonstrated that the XBP1 gene is located in the region 22pter-q13. A pseudogene was shown to be located on chromosome 5. Calfon et al. (2002) showed that the unfolded protein response (UPR) requires intact Ire1 (OMIM Ref. No. 604033) and Xbp1 in *C. elegans*. Both mouse and worm Ire1 splice a small intron from Xbp1 mRNA in response to UPR activation. Immunoblot analysis showed that, in the mouse, the processed, but not the unprocessed, 54-kD Xbp1 protein accumulates during the UPR

and depends on Ire1. Calton et al. (2002) proposed that an increased load of proteins in the endoplasmic reticulum activates Xbp1 and triggers the development of an elaborate secretory process, as seen in plasma cells. Animal model experiments lend further support to the function of XBP1. By injecting Xbp1-deficient embryonic stem cells into Rag2 (OMIM Ref. No. 179616)-deficient blastocysts, Reimold et al. (2001) generated viable Xbp1  $-/-$  mice. In these chimeric animals, Xbp1-deficient cells were abundant in lymphoid organs, variably expressed in other organs, and nearly absent from liver, consistent with the essential role of XBP1 in hepatocyte development. ELISA analysis showed low levels of immunoglobulin produced by Xbp1  $-/-$  B cells, which could be reversed by transduction of Xbp1 into the B cells. Phenotype analysis indicated that Xbp1-deficient B and T cells could be activated to undergo proliferation, cell-surface activation-marker expression, class switch recombination, and cytokine secretion at normal levels. Histologic analysis revealed a dearth of plasma cells in the organs of Xbp1  $-/-$  mice, and the cells did not express syndecan-1 (SDC1; 186355), a marker for terminally differentiated plasma cells, after immunization with DNP-albumin. Although B cells were gen-

erated in normal numbers and germinal center formation was normal, Xbp1  $-/-$  mice did not make serum antibody in response to either T cell-dependent or -independent antigens or to polyoma virus, which is normally controlled by antibodies alone. Reimold et al. (2001) concluded that the defect in Xbp1-deficient mice is distal to the effects of transcription factors essential for germinal-center formation, such as Bcl3 (OMIM Ref. No. 109560), Bcl6 (OMIM Ref. No. 109565), Nfkb (OMIM Ref. No. 164011), and Irf4 (OMIM Ref. No. 601900), and distal to the expression of Irf4 and Blimp1 (PRDM1; 603423) in immature plasma cells exiting from germinal centers. They proposed that XBP1 has target genes that are essential in plasma-cell generation

[29551] It is appreciated that the abovementioned animal model for XBP1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[29552] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[29553] Calfon, M.; Zeng, H.; Urano, F.; Till, J. H.; Hubbard, S. R.; Harding, H. P.; Clark, S. G.; Ron, D. : IRE1 couples endo-

plasmic reticulum load to secretory capacity by processing the XBP-1 mRNA. Nature 415: 92-96, 2002. ; and

[29554] Reimold, A. M.; Iwakoshi, N. N.; Manis, J.; Vallabhajosyula, P.; Szomolanyi-Tsuda, E.; Gravallesse, E. M.; Friend, D.; Grusby, M. J.; Alt, F.; Glimcher, L. H. : Plasma cell differentiation.

[29555] Further studies establishing the function and utilities of XBP1 are found in John Hopkins OMIM database record ID 194355, and in cited publications numbered 6040-6043 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. DKFZP434B044 (Accession NM\_031476) is another VGAM746 host target gene. DKFZP434B044 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434B044, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434B044 BINDING SITE, designated SEQ ID:25553, to the nucleotide sequence of VGAM746 RNA, herein designated VGAM RNA, also designated SEQ ID:3457.

[29556] Another function of VGAM746 is therefore inhibition of DKFZP434B044 (Accession NM\_031476). Accordingly,

utilities of VGAM746 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434B044. FLJ12806 (Accession NM\_022831) is another VGAM746 host target gene. FLJ12806 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12806, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12806 BINDING SITE, designated SEQ ID:23112, to the nucleotide sequence of VGAM746 RNA, herein designated VGAM RNA, also designated SEQ ID:3457.

[29557] Another function of VGAM746 is therefore inhibition of FLJ12806 (Accession NM\_022831). Accordingly, utilities of VGAM746 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12806. FLJ22635 (Accession NM\_025092) is another VGAM746 host target gene. FLJ22635 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ22635, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22635 BINDING SITE,

designated SEQ ID:24716, to the nucleotide sequence of VGAM746 RNA, herein designated VGAM RNA, also designated SEQ ID:3457.

[29558] Another function of VGAM746 is therefore inhibition of FLJ22635 (Accession NM\_025092). Accordingly, utilities of VGAM746 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22635. FLJ23604 (Accession NM\_025064) is another VGAM746 host target gene. FLJ23604 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23604, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23604 BINDING SITE, designated SEQ ID:24661, to the nucleotide sequence of VGAM746 RNA, herein designated VGAM RNA, also designated SEQ ID:3457.

[29559] Another function of VGAM746 is therefore inhibition of FLJ23604 (Accession NM\_025064). Accordingly, utilities of VGAM746 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23604. KIAA0557 (Accession XM\_085507) is another VGAM746 host target gene. KIAA0557 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by KIAA0557, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0557 BINDING SITE, designated SEQ ID:38202, to the nucleotide sequence of VGAM746 RNA, herein designated VGAM RNA, also designated SEQ ID:3457.

[29560] Another function of VGAM746 is therefore inhibition of KIAA0557 (Accession XM\_085507). Accordingly, utilities of VGAM746 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0557. LOC144742 (Accession XM\_084949) is another VGAM746 host target gene. LOC144742 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC144742, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144742 BINDING SITE, designated SEQ ID:37777, to the nucleotide sequence of VGAM746 RNA, herein designated VGAM RNA, also designated SEQ ID:3457.

[29561] Another function of VGAM746 is therefore inhibition of

LOC144742 (Accession XM\_084949). Accordingly, utilities of VGAM746 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144742. LOC145842 (Accession XM\_085254) is another VGAM746 host target gene. LOC145842 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145842, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145842 BINDING SITE, designated SEQ ID:37997, to the nucleotide sequence of VGAM746 RNA, herein designated VGAM RNA, also designated SEQ ID:3457.

[29562] Another function of VGAM746 is therefore inhibition of LOC145842 (Accession XM\_085254). Accordingly, utilities of VGAM746 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145842. LOC153711 (Accession XM\_098419) is another VGAM746 host target gene. LOC153711 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153711, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC153711 BINDING SITE, designated SEQ ID:41668, to the nucleotide sequence of VGAM746 RNA, herein designated VGAM RNA, also designated SEQ ID:3457.

[29563] Another function of VGAM746 is therefore inhibition of LOC153711 (Accession XM\_098419). Accordingly, utilities of VGAM746 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153711. LOC51008 (Accession NM\_015947) is another VGAM746 host target gene. LOC51008 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51008, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51008 BINDING SITE, designated SEQ ID:18064, to the nucleotide sequence of VGAM746 RNA, herein designated VGAM RNA, also designated SEQ ID:3457.

[29564] Another function of VGAM746 is therefore inhibition of LOC51008 (Accession NM\_015947). Accordingly, utilities of VGAM746 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51008. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 747 (VGAM747) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29565] VGAM747 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM747 was detected is described hereinabove with reference to Figs. 1–8.

[29566] VGAM747 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Coronavirus. VGAM747 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29567] VGAM747 gene encodes a VGAM747 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM747 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM747 precursor RNA is designated SEQ ID:733, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:733 is located at position 1579 relative to the genome of Bovine Coronavirus.

[29568] VGAM747 precursor RNA folds onto itself, forming VGAM747 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29569] An enzyme complex designated DICER COMPLEX, `dices` the VGAM747 folded precursor RNA into VGAM747 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM747 RNA is designated SEQ ID:3458, and is provided hereinbelow with reference to the sequence listing part.

[29570] VGAM747 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM747 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM747 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[29571] VGAM747 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM747 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM747 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM747 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM747 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[29572] The complementary binding of VGAM747 RNA, herein designated VGAM RNA, to host target binding sites on VGAM747 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM747 host target RNA into VGAM747 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29573] It is appreciated that VGAM747 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM747 host target genes. The mRNA of each one of this plurality of VGAM747 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM747 RNA, herein designated VGAM RNA, and which when bound by VGAM747 RNA causes inhibition of translation of respective one or more VGAM747 host target proteins.

[29574] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM747 gene, herein designated VGAM GENE, on one or more VGAM747 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,  
`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[29575] It is yet further appreciated that a function of VGAM747 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM747 include diagnosis, prevention and treatment of viral infection by Bovine Coronavirus. Specific functions, and accordingly utilities, of VGAM747 correlate with, and may be deduced from, the identity of the host target genes which VGAM747 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29576] Nucleotide sequences of the VGAM747 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM747 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM747 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM747 are further described hereinbelow with reference to Table 1.

[29577] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM747 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM747 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29578] As mentioned hereinabove with reference to Fig. 1, a function of VGAM747 gene, herein designated VGAM is inhibition of expression of VGAM747 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM747 correlate with, and may be deduced from, the identity of the target genes which VGAM747 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29579] Discs, Large (Drosophila) Homolog 5 (DLG5, Accession XM\_096398) is a VGAM747 host target gene. DLG5 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DLG5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DLG5 BINDING SITE, designated SEQ ID:40331, to the nucleotide sequence of VGAM747 RNA, herein designated VGAM RNA, also designated SEQ ID:3458.

[29580] A function of VGAM747 is therefore inhibition of Discs,

Large (Drosophila) Homolog 5 (DLG5, Accession XM\_096398), a gene which may transmit extracellular signals to inhibit cell proliferation. Accordingly, utilities of VGAM747 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DLG5. The function of DLG5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM444.FBJ Murine Osteosarcoma Viral Oncogene Homolog B (FOSB, Accession NM\_006732) is another VGAM747 host target gene. FOSB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FOSB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FOSB BINDING SITE, designated SEQ ID:13580, to the nucleotide sequence of VGAM747 RNA, herein designated VGAM RNA, also designated SEQ ID:3458.

[29581] Another function of VGAM747 is therefore inhibition of FBJ Murine Osteosarcoma Viral Oncogene Homolog B (FOSB, Accession NM\_006732), a gene which interacts with jun proteins enhancing their dna binding activity. Ac-

cordingly, utilities of VGAM747 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FOSB. The function of FOSB has been established by previous studies. Cocaine enhances dopamine-mediated neurotransmission by blocking dopamine reuptake at axon terminals. Most dopamine-containing nerve terminals innervate medium spiny neurons in the striatum of the brain. Cocaine addiction is thought to stem, in part, from neural adaptations that act to maintain equilibrium by countering the effects of repeated drug administration. Chronic exposure to cocaine upregulates several transcription factors that alter gene expression and which could mediate such compensatory neural and behavioral changes. One such transcription factor is delta-FosB, a protein that persists in striatum long after the end of cocaine exposure. Using DNA array analysis of striatal material from inducible transgenic mice, Bibb et al. (2001) identified Cdk5 (OMIM Ref. No. 123831) as a downstream target of delta-FosB. Overexpression of delta-FosB, or chronic cocaine administration, raised levels of Cdk5 mRNA, protein, and activity in the striatum. Moreover, injection of Cdk5 inhibitors into the striatum potentiated behavioral effects of repeated cocaine administration.

Bibb et al. (2001) concluded that changes in Cdk5 levels mediated by delta-FosB, and resulting alterations in signaling involving D1 dopamine receptors, contribute to adaptive changes in the brain related to cocaine addiction. Animal model experiments lend further support to the function of FOSB. Brown et al. (1996) demonstrated that mice in whom the FOSB gene had been inactivated by homologous recombination displayed a profound defect in reproduction. The reproductive failure of fosB mutant mice was due to a specific behavioral defect that resulted in an inability to nurture young. This nurturing defect was seen not only in postpartum females but also in young females and males. Together, these findings provided evidence that nurturing behavior in mammals is genetically controlled and that an immediate early gene, FOSB, is critical for an adaptive neuronal response. Brown et al. (1996) speculated that the nurturing defect is likely due to the absence of FOSB in the preoptic area, a region of the hypothalamus that is critical for nurturing. They stated that this is an example of a transcription factor that controls a complex behavior by regulating a specific neuronal circuit.

[29582] It is appreciated that the abovementioned animal model for FOSB is acknowledged by those skilled in the art as a

scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[29583] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[29584] Bibb, J. A.; Chen, J.; Taylor, J. R.; Svenningsson, P.; Nishi, A.; Snyder, G. L.; Yan, Z.; Sagawa, Z. K.; Ouimet, C. C.; Nairn, A. C.; Nestler, E. J.; Greengard, P. : Effects of chronic exposure to cocaine are regulated by the neuronal protein Cdk5. *Nature* 410: 376–380, 2001. ; and

[29585] Brown, J. R.; Ye, H.; Bronson, R. T.; Dikkes, P.; Greenberg, M. E. : A defect in nurturing in mice lacking the immediate early gene *fosB*. *Cell* 86: 297–309, 1996.

[29586] Further studies establishing the function and utilities of FOSB are found in John Hopkins OMIM database record ID 164772, and in cited publications numbered 4341–3828, 383 and 3830–3831 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. LOC130813 (Accession XM\_065904) is another VGAM747 host target gene. LOC130813 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC130813, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130813 BINDING SITE, designated SEQ ID:37305, to the nucleotide sequence of VGAM747 RNA, herein designated VGAM RNA, also designated SEQ ID:3458.

[29587] Another function of VGAM747 is therefore inhibition of LOC130813 (Accession XM\_065904). Accordingly, utilities of VGAM747 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130813. LOC202460 (Accession XM\_114493) is another VGAM747 host target gene. LOC202460 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC202460, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202460 BINDING SITE, designated SEQ ID:42979, to the nucleotide sequence of VGAM747 RNA, herein designated VGAM RNA, also designated SEQ ID:3458.

[29588] Another function of VGAM747 is therefore inhibition of LOC202460 (Accession XM\_114493). Accordingly, utilities of VGAM747 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC202460. LOC221895 (Accession XM\_166511) is another VGAM747 host target gene. LOC221895 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221895, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221895 BINDING SITE, designated SEQ ID:44441, to the nucleotide sequence of VGAM747 RNA, herein designated VGAM RNA, also designated SEQ ID:3458.

[29589] Another function of VGAM747 is therefore inhibition of LOC221895 (Accession XM\_166511). Accordingly, utilities of VGAM747 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221895. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 748 (VGAM748) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29590] VGAM748 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM748 was detected is described hereinabove with reference to Figs. 1–8.

[29591] VGAM748 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Coronavirus.

VGAM748 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29592] VGAM748 gene encodes a VGAM748 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM748 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM748 precursor RNA is designated SEQ ID:734, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:734 is located at position 20531 relative to the genome of Bovine Coronavirus.

[29593] VGAM748 precursor RNA folds onto itself, forming VGAM748 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence

of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29594] An enzyme complex designated DICER COMPLEX, `dices` the VGAM748 folded precursor RNA into VGAM748 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM748 RNA is designated SEQ ID:3459, and is provided hereinbelow with reference to the sequence listing part.

[29595] VGAM748 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM748 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM748 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[29596] VGAM748 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM748 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM748 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM748 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM748 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[29597] The complementary binding of VGAM748 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM748 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM748 host target RNA into VGAM748 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29598] It is appreciated that VGAM748 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM748 host target genes. The mRNA of each one of this plurality of VGAM748 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM748 RNA, herein designated VGAM RNA, and which when bound by VGAM748 RNA causes inhibition of translation of respective one or more VGAM748 host target proteins.

[29599] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM748 gene, herein designated VGAM GENE, on one or more VGAM748 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[29600] It is yet further appreciated that a function of VGAM748 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM748 include diagnosis, prevention and treatment of viral infection by Bovine Coronavirus. Specific functions, and accordingly utilities, of VGAM748 correlate with, and may be deduced from, the identity of the host target genes which VGAM748 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29601] Nucleotide sequences of the VGAM748 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM748 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM748 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM748 are further described hereinbelow with reference to Table 1.

[29602] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM748 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM748 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29603] As mentioned hereinabove with reference to Fig. 1, a function of VGAM748 gene, herein designated VGAM is inhibition of expression of VGAM748 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM748 correlate with, and may be deduced from, the identity of the target genes which VGAM748 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29604] FLJ11280 (Accession NM\_018379) is a VGAM748 host target gene. FLJ11280 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ11280, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11280 BINDING SITE, designated SEQ ID:20405, to the nucleotide sequence of VGAM748 RNA, herein designated VGAM RNA, also designated SEQ ID:3459.

[29605] A function of VGAM748 is therefore inhibition of FLJ11280 (Accession NM\_018379). Accordingly, utilities of VGAM748 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11280. KIAA0172 (Accession XM\_036295) is another VGAM748 host target gene. KIAA0172 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0172, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0172 BINDING SITE, designated SEQ ID:32410, to the nucleotide sequence of VGAM748 RNA, herein designated VGAM RNA, also designated SEQ ID:3459.

[29606] Another function of VGAM748 is therefore inhibition of KIAA0172 (Accession XM\_036295). Accordingly, utilities of VGAM748 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA0172. Solute Carrier Family 17 (sodium-dependent inorganic phosphate cotransporter), Member 6 (SLC17A6, Accession NM\_020346) is another VGAM748 host target gene. SLC17A6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC17A6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC17A6 BINDING SITE, designated SEQ ID:21596, to the nucleotide sequence of VGAM748 RNA, herein designated VGAM RNA, also designated SEQ ID:3459.

[29607] Another function of VGAM748 is therefore inhibition of Solute Carrier Family 17 (sodium-dependent inorganic phosphate cotransporter), Member 6 (SLC17A6, Accession NM\_020346). Accordingly, utilities of VGAM748 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC17A6. LOC200488 (Accession XM\_117240) is another VGAM748 host target gene. LOC200488 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200488, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200488 BINDING SITE, designated SEQ ID:43313, to the nucleotide sequence of VGAM748 RNA, herein designated VGAM RNA, also designated SEQ ID:3459.

[29608] Another function of VGAM748 is therefore inhibition of LOC200488 (Accession XM\_117240). Accordingly, utilities of VGAM748 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200488. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 749 (VGAM749) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29609] VGAM749 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM749 was detected is described hereinabove with reference to Figs. 1–8.

[29610] VGAM749 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Coronavirus.

VGAM749 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29611] VGAM749 gene encodes a VGAM749 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM749 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM749 precursor RNA is designated SEQ ID:735, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:735 is located at position 20005 relative to the genome of Bovine Coronavirus.

[29612] VGAM749 precursor RNA folds onto itself, forming VGAM749 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29613] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM749 folded precursor RNA into VGAM749 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM749 RNA is designated SEQ ID:3460, and is provided hereinbelow with reference to the sequence listing part.

[29614] VGAM749 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM749 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM749 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[29615] VGAM749 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM749 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM749 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM749 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM749 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[29616] The complementary binding of VGAM749 RNA, herein designated VGAM RNA, to host target binding sites on VGAM749 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM749 host target RNA into VGAM749 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29617] It is appreciated that VGAM749 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM749 host target genes. The mRNA of each one of this plurality of VGAM749 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM749 RNA, herein designated VGAM RNA, and which when bound by VGAM749 RNA causes inhibition of translation of respective one or more VGAM749 host target proteins.

[29618] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM749 gene, herein designated VGAM GENE, on one or more VGAM749 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[29619] It is yet further appreciated that a function of VGAM749 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM749 include diagnosis, prevention and treatment of viral infection by Bovine Coronavirus. Specific functions, and accordingly utilities, of VGAM749 correlate with, and may be deduced from, the identity of the host target genes which VGAM749 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29620] Nucleotide sequences of the VGAM749 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM749 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM749 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM749 are further described hereinbelow with reference to Table 1.

[29621] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM749 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM749 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29622] As mentioned hereinabove with reference to Fig. 1, a function of VGAM749 gene, herein designated VGAM is inhibition of expression of VGAM749 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM749 correlate with, and may be deduced from, the identity of the target genes which VGAM749 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29623] Activin A Receptor, Type I (ACVR1, Accession NM\_001105) is a VGAM749 host target gene. ACVR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ACVR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACVR1 BINDING SITE, designated SEQ ID:6762, to the nucleotide se-

quence of VGAM749 RNA, herein designated VGAM RNA, also designated SEQ ID:3460.

[29624] A function of VGAM749 is therefore inhibition of Activin A Receptor, Type I (ACVR1, Accession NM\_001105), a gene which Activin receptor-like kinase; similar to activin, TGF-beta, and C. elegans daf-1 receptors. Accordingly, utilities of VGAM749 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACVR1. The function of ACVR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM217. Hexokinase 1 (HK1, Accession NM\_000188) is another VGAM749 host target gene. HK1 BINDING SITE1 through HK1 BINDING SITE5 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by HK1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HK1 BINDING SITE1 through HK1 BINDING SITE5, designated SEQ ID:5689, SEQ ID:27267, SEQ ID:27270, SEQ ID:27273 and SEQ ID:27266 respectively, to the nucleotide sequence of VGAM749 RNA, herein designated VGAM RNA, also designated SEQ ID:3460.

[29625] Another function of VGAM749 is therefore inhibition of Hexokinase 1 (HK1, Accession NM\_000188). Accordingly, utilities of VGAM749 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HK1. Kinesin Family Member 5C (KIF5C, Accession NM\_004522) is another VGAM749 host target gene. KIF5C BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIF5C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIF5C BINDING SITE, designated SEQ ID:10852, to the nucleotide sequence of VGAM749 RNA, herein designated VGAM RNA, also designated SEQ ID:3460.

[29626] Another function of VGAM749 is therefore inhibition of Kinesin Family Member 5C (KIF5C, Accession NM\_004522). Accordingly, utilities of VGAM749 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIF5C. Steroid-5-alpha-reductase, Alpha Polypeptide 1 (3-oxo-5 alpha-steroid delta 4-dehydrogenase alpha 1) (SRD5A1, Accession NM\_001047) is another VGAM749 host target gene. SRD5A1 BINDING SITE is HOST TARGET binding site found

in the 3' untranslated region of mRNA encoded by SRD5A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SRD5A1 BINDING SITE, designated SEQ ID:6714, to the nucleotide sequence of VGAM749 RNA, herein designated VGAM RNA, also designated SEQ ID:3460.

[29627] Another function of VGAM749 is therefore inhibition of Steroid-5-alpha-reductase, Alpha Polypeptide 1 (3-oxo-5 alpha-steroid delta 4-dehydrogenase alpha 1) (SRD5A1, Accession NM\_001047), a gene which catalyzes the conversion of testosterone into 5-alpha-dihydrotestosterone and progesterone . Accordingly, utilities of VGAM749 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SRD5A1. The function of SRD5A1 has been established by previous studies. Harris et al. (1992) concluded that SRD5A1 is a minor component of the reductase activity in prostate although the gene was originally cloned from prostate. On the other hand, SRD5A1 appears to be the predominant isozyme of steroid 5-alpha-reductase in the scalp and elsewhere in the skin. The possibility of scalp-selective inhibitors being

useful in the treatment of male pattern baldness, acne, and hirsutism, all 'disorders' that appear to be dihydrotestosterone dependent, was raised. Jenkins et al. (1992) used RFLPs of the SRD5A1 gene to exclude the gene as the site of the mutation in classic 5-alpha-reductase deficiency (pseudovaginal perineoscrotal hypospadias; 264600). They further showed that in contrast to the major steroid 5-alpha-reductase in the prostate and cultured skin fibroblasts, which was designated SRD5A2, the cDNA-encoded enzyme, representing SRD5A1, exhibited a neutral to basic pH optimum and was much less sensitive to inhibition by the 4-aza steroid finasteride.

[29628] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[29629] Harris, G.; Azzolina, B.; Baginsky, W.; Cimis, G.; Rasmussen, G. H.; Tolman, R. L.; Raetz, C. R. H.; Ellsworth, K. : Identification and selective inhibition of an isozyme of steroid 5-alpha-reductase in human scalp. Proc. Nat. Acad. Sci. 89: 10787-10791, 1992. ; and

[29630] Jenkins, E. P.; Andersson, S.; Imperato-McGinley, J.; Wilson, J. D.; Russell, D. W. : Genetic and pharmacological

evidence for more than one human steroid

5- $\alpha$ -reductase. J. Clin. Invest.

[29631] Further studies establishing the function and utilities of SRD5A1 are found in John Hopkins OMIM database record ID 184753, and in cited publications numbered 12628-12631, 190 and 12632-12634 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. MGC13159 (Accession NM\_032927) is another VGAM749 host target gene. MGC13159 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC13159, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC13159 BINDING SITE, designated SEQ ID:26751, to the nucleotide sequence of VGAM749 RNA, herein designated VGAM RNA, also designated SEQ ID:3460.

[29632] Another function of VGAM749 is therefore inhibition of MGC13159 (Accession NM\_032927). Accordingly, utilities of VGAM749 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13159. MGC3020 (Accession NM\_024048) is another VGAM749 host target gene. MGC3020 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC3020, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC3020 BINDING SITE, designated SEQ ID:23483, to the nucleotide sequence of VGAM749 RNA, herein designated VGAM RNA, also designated SEQ ID:3460.

[29633] Another function of VGAM749 is therefore inhibition of MGC3020 (Accession NM\_024048). Accordingly, utilities of VGAM749 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC3020. LOC146227 (Accession XM\_085374) is another VGAM749 host target gene. LOC146227 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146227, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146227 BINDING SITE, designated SEQ ID:38081, to the nucleotide sequence of VGAM749 RNA, herein designated VGAM RNA, also designated SEQ ID:3460.

[29634] Another function of VGAM749 is therefore inhibition of

LOC146227 (Accession XM\_085374). Accordingly, utilities of VGAM749 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146227. LOC151719 (Accession XM\_087280) is another VGAM749 host target gene. LOC151719 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151719, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151719 BINDING SITE, designated SEQ ID:39161, to the nucleotide sequence of VGAM749 RNA, herein designated VGAM RNA, also designated SEQ ID:3460.

[29635] Another function of VGAM749 is therefore inhibition of LOC151719 (Accession XM\_087280). Accordingly, utilities of VGAM749 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151719. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 750 (VGAM750) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is

known in the art.

[29636] VGAM750 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM750 was detected is described hereinabove with reference to Figs. 1–8.

[29637] VGAM750 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Coronavirus. VGAM750 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29638] VGAM750 gene encodes a VGAM750 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM750 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM750 precursor RNA is designated SEQ ID:736, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:736 is located at position 9253 relative to the genome of Bovine Coronavirus.

[29639] VGAM750 precursor RNA folds onto itself, forming VGAM750 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional

`hairpin structure`. As is well known in the art, this  
`hairpin structure`, is typical of RNA encoded by miRNA  
genes, and is due to the fact that the nucleotide sequence  
of the first half of the RNA encoded by a miRNA gene is an  
accurate or partial inversed-reversed sequence of the nu-  
cleotide sequence of the second half thereof.

[29640] An enzyme complex designated DICER COMPLEX, `dices`  
the VGAM750 folded precursor RNA into VGAM750 RNA,  
herein designated VGAM RNA, a single stranded ~22 nt  
long RNA segment. As is known in the art, `dicing` of a  
hairpin structured RNA precursor product into a short  
~22nt RNA segment is catalyzed by an enzyme complex  
comprising an enzyme called Dicer together with other  
necessary proteins. A probable (over 44%) nucleotide se-  
quence of VGAM750 RNA is designated SEQ ID:3461, and  
is provided hereinbelow with reference to the sequence  
listing part.

[29641] VGAM750 host target gene, herein designated VGAM  
HOST TARGET GENE, encodes a corresponding messenger  
RNA, VGAM750 host target RNA, herein designated VGAM  
HOST TARGET RNA. VGAM750 host target RNA comprises  
three regions, as is typical of mRNA of a protein coding  
gene: a 5` untranslated region, a protein coding region

and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[29642] VGAM750 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM750 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM750 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM750 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM750 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[29643] The complementary binding of VGAM750 RNA, herein designated VGAM RNA, to host target binding sites on VGAM750 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM750 host target RNA into VGAM750 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29644] It is appreciated that VGAM750 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM750 host target genes. The mRNA of each one of this plurality of VGAM750 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM750 RNA, herein designated VGAM RNA, and which when bound by VGAM750 RNA causes inhibition of translation of respective one or more VGAM750 host target proteins.

[29645] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM750 gene, herein designated VGAM GENE, on one or

more VGAM750 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[29646] It is yet further appreciated that a function of VGAM750 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM750 include diagnosis, prevention and treatment of viral infection by Bovine Coronavirus. Specific functions, and accordingly utilities, of VGAM750 correlate with, and may be deduced from, the identity of the host target genes which VGAM750 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [29647] Nucleotide sequences of the VGAM750 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM750 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM750 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM750 are further described hereinbelow with reference to Table 1.
- [29648] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM750 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM750 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [29649] As mentioned hereinabove with reference to Fig. 1, a function of VGAM750 gene, herein designated VGAM is inhibition of expression of VGAM750 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM750 correlate with, and may be deduced from, the identity of the target genes which VGAM750 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.
- [29650] Reelin (RELN, Accession XM\_168628) is a VGAM750 host

target gene. RELN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RELN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RELN BINDING SITE, designated SEQ ID:45279, to the nucleotide sequence of VGAM750 RNA, herein designated VGAM RNA, also designated SEQ ID:3461.

[29651] A function of VGAM750 is therefore inhibition of Reelin (RELN, Accession XM\_168628), a gene which regulates microtubule function in neurons and neuronal migration. Accordingly, utilities of VGAM750 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RELN. The function of RELN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM35. Spinocerebellar Ataxia 7 (olivopontocerebellar atrophy with retinal degeneration) (SCA7, Accession NM\_000333) is another VGAM750 host target gene. SCA7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCA7, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCA7 BINDING SITE, designated SEQ ID:5882, to the nucleotide sequence of VGAM750 RNA, herein designated VGAM RNA, also designated SEQ ID:3461.

[29652] Another function of VGAM750 is therefore inhibition of Spinocerebellar Ataxia 7 (olivopontocerebellar atrophy with retinal degeneration) (SCA7, Accession NM\_000333). Accordingly, utilities of VGAM750 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCA7. FLJ20171 (Accession NM\_017697) is another VGAM750 host target gene. FLJ20171 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20171, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20171 BINDING SITE, designated SEQ ID:19260, to the nucleotide sequence of VGAM750 RNA, herein designated VGAM RNA, also designated SEQ ID:3461.

[29653] Another function of VGAM750 is therefore inhibition of FLJ20171 (Accession NM\_017697). Accordingly, utilities of

VGAM750 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20171. GG2-1 (Accession NM\_014350) is another VGAM750 host target gene. GG2-1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GG2-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GG2-1 BINDING SITE, designated SEQ ID:15677, to the nucleotide sequence of VGAM750 RNA, herein designated VGAM RNA, also designated SEQ ID:3461.

[29654] Another function of VGAM750 is therefore inhibition of GG2-1 (Accession NM\_014350). Accordingly, utilities of VGAM750 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GG2-1. LOC132235 (Accession XM\_072302) is another VGAM750 host target gene. LOC132235 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC132235, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC132235 BINDING

SITE, designated SEQ ID:37480, to the nucleotide sequence of VGAM750 RNA, herein designated VGAM RNA, also designated SEQ ID:3461.

[29655] Another function of VGAM750 is therefore inhibition of LOC132235 (Accession XM\_072302). Accordingly, utilities of VGAM750 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC132235. LOC255104 (Accession XM\_170911) is another VGAM750 host target gene. LOC255104 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255104, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255104 BINDING SITE, designated SEQ ID:45681, to the nucleotide sequence of VGAM750 RNA, herein designated VGAM RNA, also designated SEQ ID:3461.

[29656] Another function of VGAM750 is therefore inhibition of LOC255104 (Accession XM\_170911). Accordingly, utilities of VGAM750 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255104. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 751 (VGAM751) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29657] VGAM751 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM751 was detected is described hereinabove with reference to Figs. 1–8.

[29658] VGAM751 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Coronavirus. VGAM751 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29659] VGAM751 gene encodes a VGAM751 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM751 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM751 precursor RNA is designated SEQ ID:737, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:737 is located at position 17776 relative to the genome of

## Bovine Coronavirus.

[29660] VGAM751 precursor RNA folds onto itself, forming VGAM751 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29661] An enzyme complex designated DICER COMPLEX, `dices` the VGAM751 folded precursor RNA into VGAM751 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM751 RNA is designated SEQ ID:3462, and is provided hereinbelow with reference to the sequence listing part.

[29662] VGAM751 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM751 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM751 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[29663] VGAM751 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM751 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM751 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM751 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM751 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[29664] The complementary binding of VGAM751 RNA, herein designated VGAM RNA, to host target binding sites on VGAM751 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM751 host target RNA into VGAM751 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29665] It is appreciated that VGAM751 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM751 host target genes. The mRNA of each one of this plurality of VGAM751 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM751 RNA, herein designated VGAM RNA, and which when bound by VGAM751 RNA causes inhibition of translation of respective one or more VGAM751 host target proteins.

[29666] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM751 gene, herein designated VGAM GENE, on one or more VGAM751 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[29667] It is yet further appreciated that a function of VGAM751 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM751 include diagnosis, prevention and treatment of viral infection by Bovine Coronavirus. Specific functions, and accordingly utilities, of VGAM751 correlate

with, and may be deduced from, the identity of the host target genes which VGAM751 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29668] Nucleotide sequences of the VGAM751 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM751 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM751 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM751 are further described hereinbelow with reference to Table 1.

[29669] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM751 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM751 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29670] As mentioned hereinabove with reference to Fig. 1, a function of VGAM751 gene, herein designated VGAM is inhibition of expression of VGAM751 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM751 correlate with, and may be deduced

from, the identity of the target genes which VGAM751 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29671] Chemokine (C-X3-C motif) Receptor 1 (CX3CR1, Accession XM\_047502) is a VGAM751 host target gene. CX3CR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CX3CR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CX3CR1 BINDING SITE, designated SEQ ID:34976, to the nucleotide sequence of VGAM751 RNA, herein designated VGAM RNA, also designated SEQ ID:3462.

[29672] A function of VGAM751 is therefore inhibition of Chemokine (C-X3-C motif) Receptor 1 (CX3CR1, Accession XM\_047502), a gene which mediates both the adhesive and migratory functions of fractalkine. Accordingly, utilities of VGAM751 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CX3CR1. The function of CX3CR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove

with reference to VGAM25.Oxidation Resistance 1 (OXR1, Accession NM\_018002) is another VGAM751 host target gene. OXR1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by OXR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OXR1 BINDING SITE, designated SEQ ID:19732, to the nucleotide sequence of VGAM751 RNA, herein designated VGAM RNA, also designated SEQ ID:3462.

[29673] Another function of VGAM751 is therefore inhibition of Oxidation Resistance 1 (OXR1, Accession NM\_018002). Accordingly, utilities of VGAM751 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OXR1. KIAA1036 (Accession NM\_014909) is another VGAM751 host target gene. KIAA1036 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1036, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1036 BINDING SITE, designated SEQ ID:17122, to the nucleotide sequence of VGAM751 RNA, herein designated

VGAM RNA, also designated SEQ ID:3462.

[29674] Another function of VGAM751 is therefore inhibition of KIAA1036 (Accession NM\_014909). Accordingly, utilities of VGAM751 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1036. LOC120856 (Accession XM\_058509) is another VGAM751 host target gene. LOC120856 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC120856, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC120856 BINDING SITE, designated SEQ ID:36644, to the nucleotide sequence of VGAM751 RNA, herein designated VGAM RNA, also designated SEQ ID:3462.

[29675] Another function of VGAM751 is therefore inhibition of LOC120856 (Accession XM\_058509). Accordingly, utilities of VGAM751 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC120856. LOC221474 (Accession XM\_166464) is another VGAM751 host target gene. LOC221474 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC221474, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221474 BINDING SITE, designated SEQ ID:44379, to the nucleotide sequence of VGAM751 RNA, herein designated VGAM RNA, also designated SEQ ID:3462.

[29676] Another function of VGAM751 is therefore inhibition of LOC221474 (Accession XM\_166464). Accordingly, utilities of VGAM751 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221474. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 752 (VGAM752) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29677] VGAM752 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM752 was detected is described hereinabove with reference to Figs. 1–8.

[29678] VGAM752 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Coronavirus.

VGAM752 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29679] VGAM752 gene encodes a VGAM752 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM752 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM752 precursor RNA is designated SEQ ID:738, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:738 is located at position 18144 relative to the genome of Bovine Coronavirus.

[29680] VGAM752 precursor RNA folds onto itself, forming VGAM752 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29681] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM752 folded precursor RNA into VGAM752 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM752 RNA is designated SEQ ID:3463, and is provided hereinbelow with reference to the sequence listing part.

[29682] VGAM752 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM752 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM752 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[29683] VGAM752 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM752 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM752 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM752 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM752 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[29684] The complementary binding of VGAM752 RNA, herein designated VGAM RNA, to host target binding sites on VGAM752 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM752 host target RNA into VGAM752 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29685] It is appreciated that VGAM752 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM752 host target genes. The mRNA of each one of this plurality of VGAM752 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM752 RNA, herein designated VGAM RNA, and which when bound by VGAM752 RNA causes inhibition of translation of respective one or more VGAM752 host target proteins.

[29686] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM752 gene, herein designated VGAM GENE, on one or more VGAM752 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[29687] It is yet further appreciated that a function of VGAM752 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM752 include diagnosis, prevention and treatment of viral infection by Bovine Coronavirus. Specific functions, and accordingly utilities, of VGAM752 correlate with, and may be deduced from, the identity of the host target genes which VGAM752 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29688] Nucleotide sequences of the VGAM752 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM752 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM752 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM752 are further described hereinbelow with reference to Table 1.

[29689] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM752 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM752 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29690] As mentioned hereinabove with reference to Fig. 1, a function of VGAM752 gene, herein designated VGAM is inhibition of expression of VGAM752 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM752 correlate with, and may be deduced from, the identity of the target genes which VGAM752 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29691] ATPase, Aminophospholipid Transporter-like, Class I, Type 8A, Member 2 (ATP8A2, Accession XM\_167916) is a VGAM752 host target gene. ATP8A2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP8A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP8A2 BINDING

SITE, designated SEQ ID:44916, to the nucleotide sequence of VGAM752 RNA, herein designated VGAM RNA, also designated SEQ ID:3463.

[29692] A function of VGAM752 is therefore inhibition of ATPase, Aminophospholipid Transporter-like, Class I, Type 8A, Member 2 (ATP8A2, Accession XM\_167916). Accordingly, utilities of VGAM752 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP8A2. KIAA1229 (Accession XM\_030665) is another VGAM752 host target gene. KIAA1229 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1229, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1229 BINDING SITE, designated SEQ ID:31099, to the nucleotide sequence of VGAM752 RNA, herein designated VGAM RNA, also designated SEQ ID:3463.

[29693] Another function of VGAM752 is therefore inhibition of KIAA1229 (Accession XM\_030665). Accordingly, utilities of VGAM752 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1229. KIAA1509 (Accession XM\_029353) is another

VGAM752 host target gene. KIAA1509 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1509, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1509 BINDING SITE, designated SEQ ID:30871, to the nucleotide sequence of VGAM752 RNA, herein designated VGAM RNA, also designated SEQ ID:3463.

[29694] Another function of VGAM752 is therefore inhibition of KIAA1509 (Accession XM\_029353). Accordingly, utilities of VGAM752 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1509. Ubc6p (Accession NM\_058167) is another VGAM752 host target gene. Ubc6p BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by Ubc6p, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Ubc6p BINDING SITE, designated SEQ ID:27714, to the nucleotide sequence of VGAM752 RNA, herein designated VGAM RNA, also designated SEQ ID:3463.

[29695] Another function of VGAM752 is therefore inhibition of Ubc6p (Accession NM\_058167). Accordingly, utilities of VGAM752 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Ubc6p. LOC165904 (Accession XM\_093522) is another VGAM752 host target gene. LOC165904 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC165904, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC165904 BINDING SITE, designated SEQ ID:40194, to the nucleotide sequence of VGAM752 RNA, herein designated VGAM RNA, also designated SEQ ID:3463.

[29696] Another function of VGAM752 is therefore inhibition of LOC165904 (Accession XM\_093522). Accordingly, utilities of VGAM752 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC165904. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 753 (VGAM753) viral gene, which modulates expression of respective host target genes thereof,

the function and utility of which host target genes is known in the art.

[29697] VGAM753 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM753 was detected is described hereinabove with reference to Figs. 1–8.

[29698] VGAM753 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Coronavirus. VGAM753 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29699] VGAM753 gene encodes a VGAM753 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM753 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM753 precursor RNA is designated SEQ ID:739, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:739 is located at position 10788 relative to the genome of Bovine Coronavirus.

[29700] VGAM753 precursor RNA folds onto itself, forming VGAM753 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, which has a two-dimensional  
`hairpin structure`. As is well known in the art, this  
`hairpin structure`, is typical of RNA encoded by miRNA  
genes, and is due to the fact that the nucleotide sequence  
of the first half of the RNA encoded by a miRNA gene is an  
accurate or partial inversed-reversed sequence of the nu-  
cleotide sequence of the second half thereof.

[29701] An enzyme complex designated DICER COMPLEX, `dices`  
the VGAM753 folded precursor RNA into VGAM753 RNA,  
herein designated VGAM RNA, a single stranded ~22 nt  
long RNA segment. As is known in the art, `dicing` of a  
hairpin structured RNA precursor product into a short  
~22nt RNA segment is catalyzed by an enzyme complex  
comprising an enzyme called Dicer together with other  
necessary proteins. A probable (over 47%) nucleotide se-  
quence of VGAM753 RNA is designated SEQ ID:3464, and  
is provided hereinbelow with reference to the sequence  
listing part.

[29702] VGAM753 host target gene, herein designated VGAM  
HOST TARGET GENE, encodes a corresponding messenger  
RNA, VGAM753 host target RNA, herein designated VGAM  
HOST TARGET RNA. VGAM753 host target RNA comprises  
three regions, as is typical of mRNA of a protein coding

gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[29703] VGAM753 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM753 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM753 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM753 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM753 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[29704] The complementary binding of VGAM753 RNA, herein designated VGAM RNA, to host target binding sites on VGAM753 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM753 host target RNA into VGAM753 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29705] It is appreciated that VGAM753 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM753 host target genes. The mRNA of each one of this plurality of VGAM753 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM753 RNA, herein designated VGAM RNA, and which when bound by VGAM753 RNA causes inhibition of translation of respective one or more VGAM753 host target proteins.

[29706] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM753 gene, herein designated VGAM GENE, on one or more VGAM753 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[29707] It is yet further appreciated that a function of VGAM753 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM753 include diagnosis, prevention and treatment of viral infection by Bovine Coronavirus. Specific functions, and accordingly utilities, of VGAM753 correlate with, and may be deduced from, the identity of the host target genes which VGAM753 binds and inhibits, and the function of these host target genes, as elaborated herein—

below.

- [29708] Nucleotide sequences of the VGAM753 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM753 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM753 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM753 are further described hereinbelow with reference to Table 1.
- [29709] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM753 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM753 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [29710] As mentioned hereinabove with reference to Fig. 1, a function of VGAM753 gene, herein designated VGAM is inhibition of expression of VGAM753 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM753 correlate with, and may be deduced from, the identity of the target genes which VGAM753 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29711] EDR1 (Accession NM\_004426) is a VGAM753 host target gene. EDR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EDR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EDR1 BINDING SITE, designated SEQ ID:10702, to the nucleotide sequence of VGAM753 RNA, herein designated VGAM RNA, also designated SEQ ID:3464.

[29712] A function of VGAM753 is therefore inhibition of EDR1 (Accession NM\_004426). Accordingly, utilities of VGAM753 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EDR1. KIAA1423 (Accession XM\_029703) is another VGAM753 host target gene. KIAA1423 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1423, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1423 BINDING SITE, designated SEQ ID:30921, to the nucleotide sequence of VGAM753 RNA, herein designated VGAM RNA, also designated SEQ ID:3464.

[29713] Another function of VGAM753 is therefore inhibition of KIAA1423 (Accession XM\_029703). Accordingly, utilities of VGAM753 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1423. LOC149844 (Accession XM\_086675) is another VGAM753 host target gene. LOC149844 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149844, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149844 BINDING SITE, designated SEQ ID:38822, to the nucleotide sequence of VGAM753 RNA, herein designated VGAM RNA, also designated SEQ ID:3464.

[29714] Another function of VGAM753 is therefore inhibition of LOC149844 (Accession XM\_086675). Accordingly, utilities of VGAM753 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149844. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 754 (VGAM754) viral gene, which modulates expression of respective host target genes thereof,

the function and utility of which host target genes is known in the art.

[29715] VGAM754 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM754 was detected is described hereinabove with reference to Figs. 1–8.

[29716] VGAM754 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Coronavirus. VGAM754 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29717] VGAM754 gene encodes a VGAM754 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM754 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM754 precursor RNA is designated SEQ ID:740, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:740 is located at position 8401 relative to the genome of Bovine Coronavirus.

[29718] VGAM754 precursor RNA folds onto itself, forming VGAM754 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, which has a two-dimensional  
`hairpin structure`. As is well known in the art, this  
`hairpin structure`, is typical of RNA encoded by miRNA  
genes, and is due to the fact that the nucleotide sequence  
of the first half of the RNA encoded by a miRNA gene is an  
accurate or partial inversed-reversed sequence of the nu-  
cleotide sequence of the second half thereof.

[29719] An enzyme complex designated DICER COMPLEX, `dices`  
the VGAM754 folded precursor RNA into VGAM754 RNA,  
herein designated VGAM RNA, a single stranded ~22 nt  
long RNA segment. As is known in the art, `dicing` of a  
hairpin structured RNA precursor product into a short  
~22nt RNA segment is catalyzed by an enzyme complex  
comprising an enzyme called Dicer together with other  
necessary proteins. A probable (over 70%) nucleotide se-  
quence of VGAM754 RNA is designated SEQ ID:3465, and  
is provided hereinbelow with reference to the sequence  
listing part.

[29720] VGAM754 host target gene, herein designated VGAM  
HOST TARGET GENE, encodes a corresponding messenger  
RNA, VGAM754 host target RNA, herein designated VGAM  
HOST TARGET RNA. VGAM754 host target RNA comprises  
three regions, as is typical of mRNA of a protein coding

gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[29721] VGAM754 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM754 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM754 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM754 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM754 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[29722] The complementary binding of VGAM754 RNA, herein designated VGAM RNA, to host target binding sites on VGAM754 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM754 host target RNA into VGAM754 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29723] It is appreciated that VGAM754 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM754 host target genes. The mRNA of each one of this plurality of VGAM754 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM754 RNA, herein designated VGAM RNA, and which when bound by VGAM754 RNA causes inhibition of translation of respective one or more VGAM754 host target proteins.

[29724] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM754 gene, herein designated VGAM GENE, on one or more VGAM754 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[29725] It is yet further appreciated that a function of VGAM754 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM754 include diagnosis, prevention and treatment of viral infection by Bovine Coronavirus. Specific functions, and accordingly utilities, of VGAM754 correlate with, and may be deduced from, the identity of the host target genes which VGAM754 binds and inhibits, and the function of these host target genes, as elaborated herein—

below.

- [29726] Nucleotide sequences of the VGAM754 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM754 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM754 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM754 are further described hereinbelow with reference to Table 1.
- [29727] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM754 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM754 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [29728] As mentioned hereinabove with reference to Fig. 1, a function of VGAM754 gene, herein designated VGAM is inhibition of expression of VGAM754 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM754 correlate with, and may be deduced from, the identity of the target genes which VGAM754 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29729] Runt-related Transcription Factor 1 (acute myeloid leukemia 1; aml1 oncogene) (RUNX1, Accession NM\_001754) is a VGAM754 host target gene. RUNX1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RUNX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RUNX1 BINDING SITE, designated SEQ ID:7493, to the nucleotide sequence of VGAM754 RNA, herein designated VGAM RNA, also designated SEQ ID:3465.

[29730] A function of VGAM754 is therefore inhibition of Runt-related Transcription Factor 1 (acute myeloid leukemia 1; aml1 oncogene) (RUNX1, Accession NM\_001754). Accordingly, utilities of VGAM754 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RUNX1. 1-acylglycerol-3-phosphate O-acyltransferase 1 (lysophosphatidic acid acyltransferase, alpha) (AGPAT1, Accession NM\_006411) is another VGAM754 host target gene. AGPAT1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by AGPAT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AGPAT1 BINDING SITE, designated SEQ ID:13117, to the nucleotide sequence of VGAM754 RNA, herein designated VGAM RNA, also designated SEQ ID:3465.

[29731] Another function of VGAM754 is therefore inhibition of 1-acylglycerol-3-phosphate O-acyltransferase 1 (lysophosphatidic acid acyltransferase, alpha) (AGPAT1, Accession NM\_006411). Accordingly, utilities of VGAM754 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AGPAT1. DKFZP434E2135 (Accession NM\_030804) is another VGAM754 host target gene. DKFZP434E2135 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZP434E2135, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434E2135 BINDING SITE, designated SEQ ID:25112, to the nucleotide sequence of VGAM754 RNA, herein designated VGAM RNA, also designated SEQ ID:3465.

[29732] Another function of VGAM754 is therefore inhibition of

DKFZP434E2135 (Accession NM\_030804). Accordingly, utilities of VGAM754 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434E2135. M-phase Phosphoprotein 10 (U3 small nucleolar ribonucleoprotein) (MPHOSPH10, Accession XM\_030865) is another VGAM754 host target gene. MPHOSPH10 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MPHOSPH10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MPHOSPH10 BINDING SITE, designated SEQ ID:31204, to the nucleotide sequence of VGAM754 RNA, herein designated VGAM RNA, also designated SEQ ID:3465.

[29733] Another function of VGAM754 is therefore inhibition of M-phase Phosphoprotein 10 (U3 small nucleolar ribonucleoprotein) (MPHOSPH10, Accession XM\_030865). Accordingly, utilities of VGAM754 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MPHOSPH10. RENT2 (Accession NM\_080599) is another VGAM754 host target gene. RENT2 BINDING SITE1 and RENT2 BINDING SITE2 are HOST TARGET bind-

ing sites found in untranslated regions of mRNA encoded by RENT2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RENT2 BINDING SITE1 and RENT2 BINDING SITE2, designated SEQ ID:27909 and SEQ ID:17803 respectively, to the nucleotide sequence of VGAM754 RNA, herein designated VGAM RNA, also designated SEQ ID:3465.

[29734] Another function of VGAM754 is therefore inhibition of RENT2 (Accession NM\_080599). Accordingly, utilities of VGAM754 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RENT2. LOC146332 (Accession XM\_085413) is another VGAM754 host target gene. LOC146332 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146332, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146332 BINDING SITE, designated SEQ ID:38129, to the nucleotide sequence of VGAM754 RNA, herein designated VGAM RNA, also designated SEQ ID:3465.

[29735] Another function of VGAM754 is therefore inhibition of LOC146332 (Accession XM\_085413). Accordingly, utilities of VGAM754 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146332. LOC150519 (Accession XM\_086937) is another VGAM754 host target gene. LOC150519 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150519, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150519 BINDING SITE, designated SEQ ID:38987, to the nucleotide sequence of VGAM754 RNA, herein designated VGAM RNA, also designated SEQ ID:3465.

[29736] Another function of VGAM754 is therefore inhibition of LOC150519 (Accession XM\_086937). Accordingly, utilities of VGAM754 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150519. LOC196446 (Accession XM\_113722) is another VGAM754 host target gene. LOC196446 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC196446, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196446 BINDING SITE, designated SEQ ID:42371, to the nucleotide sequence of VGAM754 RNA, herein designated VGAM RNA, also designated SEQ ID:3465.

[29737] Another function of VGAM754 is therefore inhibition of LOC196446 (Accession XM\_113722). Accordingly, utilities of VGAM754 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196446. LOC90233 (Accession NM\_138347) is another VGAM754 host target gene. LOC90233 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90233, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90233 BINDING SITE, designated SEQ ID:28744, to the nucleotide sequence of VGAM754 RNA, herein designated VGAM RNA, also designated SEQ ID:3465.

[29738] Another function of VGAM754 is therefore inhibition of LOC90233 (Accession NM\_138347). Accordingly, utilities of VGAM754 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC90233. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 755 (VGAM755) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29739] VGAM755 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM755 was detected is described hereinabove with reference to Figs. 1–8.

[29740] VGAM755 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Coronavirus. VGAM755 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29741] VGAM755 gene encodes a VGAM755 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM755 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM755 precursor RNA is designated SEQ ID:741, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:741 is located at position 5925 relative to the genome of Bovine Coronavirus.

[29742] VGAM755 precursor RNA folds onto itself, forming VGAM755 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29743] An enzyme complex designated DICER COMPLEX, `dices` the VGAM755 folded precursor RNA into VGAM755 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 59%) nucleotide sequence of VGAM755 RNA is designated SEQ ID:3466, and is provided hereinbelow with reference to the sequence listing part.

[29744] VGAM755 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM755 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM755 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[29745] VGAM755 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM755 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM755 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM755 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM755 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[29746] The complementary binding of VGAM755 RNA, herein designated VGAM RNA, to host target binding sites on VGAM755 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM755 host target RNA into VGAM755 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29747] It is appreciated that VGAM755 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM755 host target genes. The mRNA of each one of this plurality of VGAM755 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM755 RNA, herein designated VGAM RNA, and which when bound by VGAM755 RNA causes in-

hibition of translation of respective one or more VGAM755 host target proteins.

[29748] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM755 gene, herein designated VGAM GENE, on one or more VGAM755 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[29749] It is yet further appreciated that a function of VGAM755 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM755 include diagnosis, prevention and

treatment of viral infection by Bovine Coronavirus. Specific functions, and accordingly utilities, of VGAM755 correlate with, and may be deduced from, the identity of the host target genes which VGAM755 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29750] Nucleotide sequences of the VGAM755 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM755 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM755 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM755 are further described hereinbelow with reference to Table 1.

[29751] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM755 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM755 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29752] As mentioned hereinabove with reference to Fig. 1, a function of VGAM755 gene, herein designated VGAM is inhibition of expression of VGAM755 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM755 correlate with, and may be deduced from, the identity of the target genes which VGAM755 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29753] GDP Dissociation Inhibitor 2 (GDI2, Accession NM\_001494) is a VGAM755 host target gene. GDI2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GDI2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GDI2 BINDING SITE, designated SEQ ID:7241, to the nucleotide sequence of VGAM755 RNA, herein designated VGAM RNA, also designated SEQ ID:3466.

[29754] A function of VGAM755 is therefore inhibition of GDP Dissociation Inhibitor 2 (GDI2, Accession NM\_001494), a gene which regulates the gdp/gtp exchange reaction of most rab proteins by inhibiting the dissociation of gdp from them, and the subsequent binding of gtp to them. Accordingly, utilities of VGAM755 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GDI2. The function of GDI2 has been es-

established by previous studies. Various rab GDI-beta (RABGDIB) genes have been identified in a variety of species. It is a member of the GDP-dissociation inhibitor family, which includes GDI-alpha (RABGDIA; 300104). Shisheva et al. (1994) cloned mouse RABGDIB (which they referred to as 'smg p25A GDI') and reported the sequence. Sedlacek et al. (1995) found that the human RABGDIB sequence is 86.5% similar to RABGDIA, which they referred to as 'XAP-4.' Bachner et al. (1995) studied expression patterns of the 2 human genes. They showed that the 2.5-kb mRNA for RABGDIB is ubiquitously expressed, in contrast to RABGDIA, which is expressed primarily in neural and sensory tissues. By in situ hybridization, Sedlacek et al. (1998) demonstrated that the GDI2 gene maps to 10p15; a processed pseudogene mapped to 7p13-p11.

[29755] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[29756] Sedlacek, Z.; Munstermann, E.; Mincheva, A.; Lichter, P.; Poustka, A. : The human rab GDI beta gene with long retroposon-rich introns maps to 10p15 and its pseudogene to 7p11-p13. Mammalian Genome 9: 78-80, 1998. ; and

[29757] Shisheva, A.; Sudhof, T. C.; Czech, M. P. : Cloning, characterization, and expression of a novel GDP dissociation inhibitor isoform from skeletal muscle. *Molec. Cell. Biol.* 14: 3459–346.

[29758] Further studies establishing the function and utilities of GDI2 are found in John Hopkins OMIM database record ID 600767, and in cited publications numbered 8799, 9601–960 and 9062 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Chromosome 20 Open Reading Frame 43 (C20orf43, Accession XM\_009549) is another VGAM755 host target gene. C20orf43 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf43, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf43 BINDING SITE, designated SEQ ID:30112, to the nucleotide sequence of VGAM755 RNA, herein designated VGAM RNA, also designated SEQ ID:3466.

[29759] Another function of VGAM755 is therefore inhibition of Chromosome 20 Open Reading Frame 43 (C20orf43, Accession XM\_009549). Accordingly, utilities of VGAM755

include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf43. Chromosome 20 Open Reading Frame 82 (C20orf82, Accession XM\_097736) is another VGAM755 host target gene.

C20orf82 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf82, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf82 BINDING SITE, designated SEQ ID:41085, to the nucleotide sequence of VGAM755 RNA, herein designated VGAM RNA, also designated SEQ ID:3466.

[29760] Another function of VGAM755 is therefore inhibition of Chromosome 20 Open Reading Frame 82 (C20orf82, Accession XM\_097736). Accordingly, utilities of VGAM755 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf82. MGC12966 (Accession NM\_032706) is another VGAM755 host target gene. MGC12966 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC12966, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC12966 BINDING SITE, designated SEQ ID:26418, to the nucleotide sequence of VGAM755 RNA, herein designated VGAM RNA, also designated SEQ ID:3466.

[29761] Another function of VGAM755 is therefore inhibition of MGC12966 (Accession NM\_032706). Accordingly, utilities of VGAM755 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC12966. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 756 (VGAM756) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29762] VGAM756 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM756 was detected is described hereinabove with reference to Figs. 1–8.

[29763] VGAM756 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Coronavirus. VGAM756 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[29764] VGAM756 gene encodes a VGAM756 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM756 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM756 precursor RNA is designated SEQ ID:742, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:742 is located at position 15954 relative to the genome of Bovine Coronavirus.

[29765] VGAM756 precursor RNA folds onto itself, forming VGAM756 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29766] An enzyme complex designated DICER COMPLEX, `dices` the VGAM756 folded precursor RNA into VGAM756 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM756 RNA is designated SEQ ID:3467, and is provided hereinbelow with reference to the sequence listing part.

[29767] VGAM756 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM756 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM756 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[29768] VGAM756 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM756 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM756 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM756 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM756 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[29769] The complementary binding of VGAM756 RNA, herein designated VGAM RNA, to host target binding sites on VGAM756 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM756 host target RNA into VGAM756 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[29770] It is appreciated that VGAM756 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM756 host target genes. The mRNA of each one of this plurality of VGAM756 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM756 RNA, herein designated VGAM RNA, and which when bound by VGAM756 RNA causes inhibition of translation of respective one or more VGAM756 host target proteins.

[29771] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM756 gene, herein designated VGAM GENE, on one or more VGAM756 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[29772] It is yet further appreciated that a function of VGAM756 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM756 include diagnosis, prevention and treatment of viral infection by Bovine Coronavirus. Specific functions, and accordingly utilities, of VGAM756 correlate with, and may be deduced from, the identity of the host target genes which VGAM756 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29773] Nucleotide sequences of the VGAM756 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM756 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM756 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM756 are further described hereinbelow with reference to Table 1.

[29774] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM756 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM756 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29775] As mentioned hereinabove with reference to Fig. 1, a function of VGAM756 gene, herein designated VGAM is inhibition of expression of VGAM756 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM756 correlate with, and may be deduced from, the identity of the target genes which VGAM756 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29776] Ubiquitin-conjugating Enzyme E2L 3 (UBE2L3, Accession NM\_003347) is a VGAM756 host target gene. UBE2L3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UBE2L3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBE2L3 BINDING SITE, designated SEQ ID:9354, to the nucleotide sequence of VGAM756 RNA, herein designated

VGAM RNA, also designated SEQ ID:3467.

[29777] A function of VGAM756 is therefore inhibition of Ubiquitin-conjugating Enzyme E2L 3 (UBE2L3, Accession NM\_003347), a gene which catalyzes the covalent attachment of ubiquitin to other proteins. Accordingly, utilities of VGAM756 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE2L3. The function of UBE2L3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM215. Angiomotin (AMOT, Accession NM\_133265) is another VGAM756 host target gene. AMOT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AMOT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AMOT BINDING SITE, designated SEQ ID:28416, to the nucleotide sequence of VGAM756 RNA, herein designated VGAM RNA, also designated SEQ ID:3467.

[29778] Another function of VGAM756 is therefore inhibition of Angiomotin (AMOT, Accession NM\_133265). Accordingly, utilities of VGAM756 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with AMOT. FLJ13195 (Accession NM\_022906) is another VGAM756 host target gene. FLJ13195 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13195, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13195 BINDING SITE, designated SEQ ID:23203, to the nucleotide sequence of VGAM756 RNA, herein designated VGAM RNA, also designated SEQ ID:3467.

[29779] Another function of VGAM756 is therefore inhibition of FLJ13195 (Accession NM\_022906). Accordingly, utilities of VGAM756 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13195. FLJ23132 (Accession XM\_171194) is another VGAM756 host target gene. FLJ23132 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23132, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23132 BINDING SITE, designated SEQ ID:45983, to the nucleotide sequence of

VGAM756 RNA, herein designated VGAM RNA, also designated SEQ ID:3467.

[29780] Another function of VGAM756 is therefore inhibition of FLJ23132 (Accession XM\_171194). Accordingly, utilities of VGAM756 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23132. HSPC039 (Accession NM\_016097) is another VGAM756 host target gene. HSPC039 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSPC039, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPC039 BINDING SITE, designated SEQ ID:18180, to the nucleotide sequence of VGAM756 RNA, herein designated VGAM RNA, also designated SEQ ID:3467.

[29781] Another function of VGAM756 is therefore inhibition of HSPC039 (Accession NM\_016097). Accordingly, utilities of VGAM756 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC039. PTPRF Interacting Protein, Binding Protein 1 (liprin beta 1) (PPFIBP1, Accession NM\_003622) is another VGAM756 host target gene. PPFIBP1 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by PPFIBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPFIBP1 BINDING SITE, designated SEQ ID:9685, to the nucleotide sequence of VGAM756 RNA, herein designated VGAM RNA, also designated SEQ ID:3467.

[29782] Another function of VGAM756 is therefore inhibition of PTPRF Interacting Protein, Binding Protein 1 (liprin beta 1) (PPFIBP1, Accession NM\_003622). Accordingly, utilities of VGAM756 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPFIBP1. PR Domain Containing 8 (PRDM8, Accession NM\_020226) is another VGAM756 host target gene. PRDM8 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRDM8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRDM8 BINDING SITE, designated SEQ ID:21488, to the nucleotide sequence of VGAM756 RNA, herein designated VGAM RNA, also designated SEQ ID:3467.

[29783] Another function of VGAM756 is therefore inhibition of PR Domain Containing 8 (PRDM8, Accession NM\_020226). Accordingly, utilities of VGAM756 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRDM8. LOC122726 (Accession XM\_063296) is another VGAM756 host target gene. LOC122726 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC122726, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC122726 BINDING SITE, designated SEQ ID:37236, to the nucleotide sequence of VGAM756 RNA, herein designated VGAM RNA, also designated SEQ ID:3467.

[29784] Another function of VGAM756 is therefore inhibition of LOC122726 (Accession XM\_063296). Accordingly, utilities of VGAM756 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC122726. LOC83690 (Accession NM\_031461) is another VGAM756 host target gene. LOC83690 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC83690, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC83690 BINDING SITE, designated SEQ ID:25485, to the nucleotide sequence of VGAM756 RNA, herein designated VGAM RNA, also designated SEQ ID:3467.

[29785] Another function of VGAM756 is therefore inhibition of LOC83690 (Accession NM\_031461). Accordingly, utilities of VGAM756 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC83690. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 757 (VGAM757) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29786] VGAM757 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM757 was detected is described hereinabove with reference to Figs. 1–8.

[29787] VGAM757 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Coronavirus.

VGAM757 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29788] VGAM757 gene encodes a VGAM757 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM757 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM757 precursor RNA is designated SEQ ID:743, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:743 is located at position 378 relative to the genome of Bovine Coronavirus.

[29789] VGAM757 precursor RNA folds onto itself, forming VGAM757 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29790] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM757 folded precursor RNA into VGAM757 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM757 RNA is designated SEQ ID:3468, and is provided hereinbelow with reference to the sequence listing part.

[29791] VGAM757 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM757 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM757 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[29792] VGAM757 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM757 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM757 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM757 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM757 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[29793] The complementary binding of VGAM757 RNA, herein designated VGAM RNA, to host target binding sites on VGAM757 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM757 host target RNA into VGAM757 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29794] It is appreciated that VGAM757 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM757 host target genes. The mRNA of each one of this plurality of VGAM757 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM757 RNA, herein designated VGAM RNA, and which when bound by VGAM757 RNA causes inhibition of translation of respective one or more VGAM757 host target proteins.

[29795] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM757 gene, herein designated VGAM GENE, on one or more VGAM757 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[29796] It is yet further appreciated that a function of VGAM757 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM757 include diagnosis, prevention and treatment of viral infection by Bovine Coronavirus. Specific functions, and accordingly utilities, of VGAM757 correlate with, and may be deduced from, the identity of the host target genes which VGAM757 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29797] Nucleotide sequences of the VGAM757 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM757 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM757 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM757 are further described hereinbelow with reference to Table 1.

[29798] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM757 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM757 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29799] As mentioned hereinabove with reference to Fig. 1, a function of VGAM757 gene, herein designated VGAM is inhibition of expression of VGAM757 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM757 correlate with, and may be deduced from, the identity of the target genes which VGAM757 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29800] Zinc Finger Protein 207 (ZNF207, Accession NM\_003457) is a VGAM757 host target gene. ZNF207 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF207, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF207 BINDING SITE, designated SEQ ID:9515, to the nucleotide

sequence of VGAM757 RNA, herein designated VGAM RNA, also designated SEQ ID:3468.

[29801] A function of VGAM757 is therefore inhibition of Zinc Finger Protein 207 (ZNF207, Accession NM\_003457). Accordingly, utilities of VGAM757 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF207. FLJ23309 (Accession NM\_024896) is another VGAM757 host target gene. FLJ23309 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23309, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23309 BINDING SITE, designated SEQ ID:24381, to the nucleotide sequence of VGAM757 RNA, herein designated VGAM RNA, also designated SEQ ID:3468.

[29802] Another function of VGAM757 is therefore inhibition of FLJ23309 (Accession NM\_024896). Accordingly, utilities of VGAM757 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23309. Sprouty Homolog 1, Antagonist of FGF Signaling (Drosophila) (SPRY1, Accession XM\_036349) is another VGAM757 host target gene. SPRY1 BINDING SITE is HOST

TARGET binding site found in the 5` untranslated region of mRNA encoded by SPRY1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPRY1 BINDING SITE, designated SEQ ID:32429, to the nucleotide sequence of VGAM757 RNA, herein designated VGAM RNA, also designated SEQ ID:3468.

[29803] Another function of VGAM757 is therefore inhibition of Sprouty Homolog 1, Antagonist of FGF Signaling (Drosophila) (SPRY1, Accession XM\_036349). Accordingly, utilities of VGAM757 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPRY1. LOC91431 (Accession NM\_138698) is another VGAM757 host target gene. LOC91431 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC91431, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91431 BINDING SITE, designated SEQ ID:28948, to the nucleotide sequence of VGAM757 RNA, herein designated VGAM RNA, also designated SEQ ID:3468.

[29804] Another function of VGAM757 is therefore inhibition of LOC91431 (Accession NM\_138698). Accordingly, utilities of VGAM757 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91431. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 758 (VGAM758) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29805] VGAM758 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM758 was detected is described hereinabove with reference to Figs. 1–8.

[29806] VGAM758 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Coronavirus. VGAM758 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29807] VGAM758 gene encodes a VGAM758 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM758

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM758 precursor RNA is designated SEQ ID:744, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:744 is located at position 14862 relative to the genome of Bovine Coronavirus.

[29808] VGAM758 precursor RNA folds onto itself, forming VGAM758 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29809] An enzyme complex designated DICER COMPLEX, `dices` the VGAM758 folded precursor RNA into VGAM758 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 47%) nucleotide sequence of VGAM758 RNA is designated SEQ ID:3469, and is provided hereinbelow with reference to the sequence listing part.

[29810] VGAM758 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM758 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM758 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[29811] VGAM758 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM758 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM758 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM758 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM758 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[29812] The complementary binding of VGAM758 RNA, herein designated VGAM RNA, to host target binding sites on VGAM758 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM758 host target RNA into VGAM758 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29813] It is appreciated that VGAM758 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM758 host target genes. The mRNA of each one of this plurality of VGAM758 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM758 RNA, herein designated VGAM RNA, and which when bound by VGAM758 RNA causes inhibition of translation of respective one or more VGAM758 host target proteins.

[29814] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM758 gene, herein designated VGAM GENE, on one or more VGAM758 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[29815] It is yet further appreciated that a function of VGAM758 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM758 include diagnosis, prevention and treatment of viral infection by Bovine Coronavirus. Specific functions, and accordingly utilities, of VGAM758 correlate with, and may be deduced from, the identity of the host target genes which VGAM758 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29816] Nucleotide sequences of the VGAM758 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM758 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM758 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM758 are further described hereinbelow with reference to Table 1.

[29817] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM758 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM758 RNA, herein designated VGAM RNA, are described hereinbelow with refer-

ence to Table 2.

[29818] As mentioned hereinabove with reference to Fig. 1, a function of VGAM758 gene, herein designated VGAM is inhibition of expression of VGAM758 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM758 correlate with, and may be deduced from, the identity of the target genes which VGAM758 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29819] Polycystic Kidney and Hepatic Disease 1 (autosomal recessive) (PKHD1, Accession NM\_138694) is a VGAM758 host target gene. PKHD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PKHD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PKHD1 BINDING SITE, designated SEQ ID:28945, to the nucleotide sequence of VGAM758 RNA, herein designated VGAM RNA, also designated SEQ ID:3469.

[29820] A function of VGAM758 is therefore inhibition of Polycystic Kidney and Hepatic Disease 1 (autosomal recessive) (PKHD1, Accession NM\_138694). Accordingly, utilities of

VGAM758 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PKHD1. RNA (guanine-7-) Methyltransferase (RNMT, Accession NM\_003799) is another VGAM758 host target gene. RNMT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNMT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNMT BINDING SITE, designated SEQ ID:9893, to the nucleotide sequence of VGAM758 RNA, herein designated VGAM RNA, also designated SEQ ID:3469.

[29821] Another function of VGAM758 is therefore inhibition of RNA (guanine-7-) Methyltransferase (RNMT, Accession NM\_003799), a gene which catalyzes the methylation of GpppN- at the guanine N7 position. Accordingly, utilities of VGAM758 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNMT. The function of RNMT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM178.FLJ23056 (Accession NM\_024582) is another VGAM758 host target gene. FLJ23056 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23056, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23056 BINDING SITE, designated SEQ ID:23807, to the nucleotide sequence of VGAM758 RNA, herein designated VGAM RNA, also designated SEQ ID:3469.

[29822] Another function of VGAM758 is therefore inhibition of FLJ23056 (Accession NM\_024582). Accordingly, utilities of VGAM758 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23056. IPT (Accession NM\_017646) is another VGAM758 host target gene. IPT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IPT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IPT BINDING SITE, designated SEQ ID:19151, to the nucleotide sequence of VGAM758 RNA, herein designated VGAM RNA, also designated SEQ ID:3469.

[29823] Another function of VGAM758 is therefore inhibition of IPT (Accession NM\_017646). Accordingly, utilities of

VGAM758 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IPT.

MDS028 (Accession NM\_018463) is another VGAM758 host target gene. MDS028 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MDS028, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MDS028 BINDING SITE, designated SEQ ID:20535, to the nucleotide sequence of VGAM758 RNA, herein designated VGAM RNA, also designated SEQ ID:3469.

[29824] Another function of VGAM758 is therefore inhibition of MDS028 (Accession NM\_018463). Accordingly, utilities of VGAM758 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MDS028. LOC137492 (Accession XM\_059910) is another VGAM758 host target gene. LOC137492 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC137492, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC137492 BINDING

SITE, designated SEQ ID:37107, to the nucleotide sequence of VGAM758 RNA, herein designated VGAM RNA, also designated SEQ ID:3469.

[29825] Another function of VGAM758 is therefore inhibition of LOC137492 (Accession XM\_059910). Accordingly, utilities of VGAM758 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC137492. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 759 (VGAM759) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29826] VGAM759 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM759 was detected is described hereinabove with reference to Figs. 1–8.

[29827] VGAM759 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Coronavirus. VGAM759 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29828] VGAM759 gene encodes a VGAM759 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM759 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM759 precursor RNA is designated SEQ ID:745, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:745 is located at position 7762 relative to the genome of Bovine Coronavirus.

[29829] VGAM759 precursor RNA folds onto itself, forming VGAM759 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29830] An enzyme complex designated DICER COMPLEX, `dices` the VGAM759 folded precursor RNA into VGAM759 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM759 RNA is designated SEQ ID:3470, and is provided hereinbelow with reference to the sequence listing part.

[29831] VGAM759 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM759 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM759 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[29832] VGAM759 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM759 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM759 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM759 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM759 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[29833] The complementary binding of VGAM759 RNA, herein designated VGAM RNA, to host target binding sites on VGAM759 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM759 host target RNA into VGAM759 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29834] It is appreciated that VGAM759 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM759 host target genes. The mRNA of each one of this plurality of VGAM759 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM759 RNA, herein designated VGAM RNA, and which when bound by VGAM759 RNA causes inhibition of translation of respective one or more VGAM759 host target proteins.

[29835] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM759 gene, herein designated VGAM GENE, on one or more VGAM759 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,  
`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[29836] It is yet further appreciated that a function of VGAM759 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM759 include diagnosis, prevention and treatment of viral infection by Bovine Coronavirus. Specific functions, and accordingly utilities, of VGAM759 correlate with, and may be deduced from, the identity of the host target genes which VGAM759 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29837] Nucleotide sequences of the VGAM759 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM759 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM759 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM759 are further described hereinbelow with reference to Table 1.

[29838] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM759 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM759 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29839] As mentioned hereinabove with reference to Fig. 1, a function of VGAM759 gene, herein designated VGAM is inhibition of expression of VGAM759 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM759 correlate with, and may be deduced from, the identity of the target genes which VGAM759 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29840] Transient Receptor Potential Cation Channel, Subfamily C, Member 5 (TRPC5, Accession NM\_012471) is a VGAM759 host target gene. TRPC5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRPC5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPC5 BINDING SITE, designated SEQ ID:14849, to the nucleotide sequence of VGAM759 RNA, herein designated VGAM RNA, also designated SEQ ID:3470.

[29841] A function of VGAM759 is therefore inhibition of Transient Receptor Potential Cation Channel, Subfamily C, Member 5 (TRPC5, Accession NM\_012471). Accordingly, utilities of VGAM759 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPC5. KIAA0090 (Accession XM\_114045) is another VGAM759 host target gene. KIAA0090 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0090, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0090 BINDING SITE, designated SEQ ID:42651, to the nucleotide sequence of VGAM759 RNA, herein designated VGAM RNA, also designated SEQ ID:3470.

[29842] Another function of VGAM759 is therefore inhibition of KIAA0090 (Accession XM\_114045). Accordingly, utilities of VGAM759 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0090. LOC138199 (Accession XM\_059950) is another VGAM759 host target gene. LOC138199 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC138199, corresponding

to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC138199 BINDING SITE, designated SEQ ID:37117, to the nucleotide sequence of VGAM759 RNA, herein designated VGAM RNA, also designated SEQ ID:3470.

[29843] Another function of VGAM759 is therefore inhibition of LOC138199 (Accession XM\_059950). Accordingly, utilities of VGAM759 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC138199. LOC254228 (Accession XM\_171123) is another VGAM759 host target gene. LOC254228 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254228, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254228 BINDING SITE, designated SEQ ID:45916, to the nucleotide sequence of VGAM759 RNA, herein designated VGAM RNA, also designated SEQ ID:3470.

[29844] Another function of VGAM759 is therefore inhibition of LOC254228 (Accession XM\_171123). Accordingly, utilities of VGAM759 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC254228. LOC254251 (Accession XM\_171088) is another VGAM759 host target gene. LOC254251 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254251, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254251 BINDING SITE, designated SEQ ID:45900, to the nucleotide sequence of VGAM759 RNA, herein designated VGAM RNA, also designated SEQ ID:3470.

[29845] Another function of VGAM759 is therefore inhibition of LOC254251 (Accession XM\_171088). Accordingly, utilities of VGAM759 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254251. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 760 (VGAM760) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29846] VGAM760 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM760 was detected is described hereinabove with reference to Figs. 1–8.

[29847] VGAM760 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Coronavirus. VGAM760 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29848] VGAM760 gene encodes a VGAM760 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM760 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM760 precursor RNA is designated SEQ ID:746, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:746 is located at position 14942 relative to the genome of Bovine Coronavirus.

[29849] VGAM760 precursor RNA folds onto itself, forming VGAM760 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA

genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29850] An enzyme complex designated DICER COMPLEX, `dices` the VGAM760 folded precursor RNA into VGAM760 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM760 RNA is designated SEQ ID:3471, and is provided hereinbelow with reference to the sequence listing part.

[29851] VGAM760 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM760 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM760 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[29852] VGAM760 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM760 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM760 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM760 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM760 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[29853] The complementary binding of VGAM760 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM760 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM760 host target RNA into VGAM760 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29854] It is appreciated that VGAM760 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM760 host target genes. The mRNA of each one of this plurality of VGAM760 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM760 RNA, herein designated VGAM RNA, and which when bound by VGAM760 RNA causes inhibition of translation of respective one or more VGAM760 host target proteins.

[29855] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM760 gene, herein designated VGAM GENE, on one or more VGAM760 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[29856] It is yet further appreciated that a function of VGAM760 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM760 include diagnosis, prevention and treatment of viral infection by Bovine Coronavirus. Specific functions, and accordingly utilities, of VGAM760 correlate with, and may be deduced from, the identity of the host target genes which VGAM760 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29857] Nucleotide sequences of the VGAM760 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM760 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM760 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM760 are further described hereinbelow with reference to Table 1.

[29858] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM760 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM760 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29859] As mentioned hereinabove with reference to Fig. 1, a function of VGAM760 gene, herein designated VGAM is inhibition of expression of VGAM760 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM760 correlate with, and may be deduced from, the identity of the target genes which VGAM760 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29860] Erythrocyte Membrane Protein Band 4.9 (dematin) (EPB49, Accession NM\_001978) is a VGAM760 host target gene. EPB49 BINDING SITE is HOST TARGET binding site found in

the 3' untranslated region of mRNA encoded by EPB49, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPB49 BINDING SITE, designated SEQ ID:7710, to the nucleotide sequence of VGAM760 RNA, herein designated VGAM RNA, also designated SEQ ID:3471.

[29861] A function of VGAM760 is therefore inhibition of Erythrocyte Membrane Protein Band 4.9 (dematin) (EPB49, Accession NM\_001978), a gene which is an actin-bundling protein. Accordingly, utilities of VGAM760 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPB49. The function of EPB49 has been established by previous studies. Chishti et al. (1989) proposed the name dematin (from the Greek 'dema,' a bundle) for an actin-bundling protein originally identified in the human erythroid membrane skeleton. It consists of 2 polypeptide chains of 48 and 52 kD that have been identified as protein 4.9 on SDS/polyacrylamide gels. In solution, dematin exists as a trimer and bundles actin filaments in a phosphorylation-dependent manner. Its actin-bundling activity is abolished upon phosphorylation by cAMP-dependent protein kinase and is restored after

dephosphorylation. See review of Gilligan and Bennett (1993). Rana et al. (1993) reported the complete primary structure of human erythroid dematin, whose sequence includes a homolog of the 'headpiece' sequence found at the C-terminus of villin (OMIM Ref. No. 193040). The headpiece is essential for villin function in inducing microvillar development and actin redistribution. The widespread expression of dematin transcripts in human tissue suggests that dematin and its homologs may substitute for villin in villin-negative tissues to regulate actin reorganization by a phosphorylation-regulated mechanism. Peters et al. (1995) demonstrated that the murine dematin gene, symbolized Epb4.9, maps to chromosome 14. They raised the possibility that dematin mutations may be involved in neurologic abnormalities in the mouse. Although dematin is an actin-bundling protein of the erythroid membrane skeleton, it is abundantly expressed in human brain, heart, skeletal muscle, kidney, and lung. Azim et al. (1995) noted that the 48-kD subunit of dematin contains the headpiece domain of villin which is essential for its morphogenic function in vivo. Azim et al. (1995) reported the primary structure of the 52-kD subunit of dematin which differs from the 48-kD subunit by a

22-amino acid insertion within its headpiece domain. A unique feature of the insertion sequence of the 52-kD subunit is its homology to erythrocyte protein 4.2 (OMIM Ref. No. 177070). Using somatic cell hybrid panels and fluorescence in situ hybridization, Azim et al. (1995) localized the dematin gene to 8p21.1, a site distal to the locus of ankyrin (OMIM Ref. No. 182900) at 8p11.2. Azim et al. (1996) demonstrated that dematin and protein 4.2 (OMIM Ref. No. 177070) bind ATP. Although the functional significance is not clear, the findings open new perspectives for the function of these 2 proteins in vivo. By using homologous recombination in mouse embryonic stem cells, Khanna et al. (2002) deleted the headpiece domain of dematin to evaluate its function in vivo. Dematin headpiece-null mice were viable and born at the expected mendelian ratio. Hematologic evaluation showed evidence of compensated anemia and spherocytosis in these mice, however. The headpiece-null erythrocytes were osmotically fragile, and displayed reduced deformability and filterability. In vitro, significantly greater membrane fragmentation of these erythrocytes was demonstrated. Biochemical characterization showed a weakened membrane skeleton evidenced by reduced association of spectrin and

actin to the plasma membrane. Together, these results provided evidence for the physiologic significance of dematin and demonstrated a role for the headpiece domain in the maintenance of structural integrity and mechanical properties of red cells in vivo.

[29862] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[29863] Khanna, R.; Chang, S. H.; Andrabi, S.; Azam, M.; Kim, A.; Rivera, A.; Brugnara, C.; Low, P. S.; Liu, S.-C.; Chishti, A. H. : Headpiece domain of dematin is required for the stability of the erythrocyte membrane. *Proc. Nat. Acad. Sci.* 99: 6637–6642, 2002. ; and

[29864] Peters, L. L.; Eicher, E. M.; Azim, A. C.; Chishti, A. H. : The gene encoding the erythrocyte membrane skeleton protein dematin (Epb4.9) maps to mouse chromosome 14. *Genomics* 26: 634–63.

[29865] Further studies establishing the function and utilities of EPB49 are found in John Hopkins OMIM database record ID 125305, and in cited publications numbered 2664–2670 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Coagulation Factor II (thrombin) Receptor-like 3 (F2RL3, Accession

NM\_003950) is another VGAM760 host target gene. F2RL3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by F2RL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of F2RL3 BINDING SITE, designated SEQ ID:10082, to the nucleotide sequence of VGAM760 RNA, herein designated VGAM RNA, also designated SEQ ID:3471.

[29866] Another function of VGAM760 is therefore inhibition of Coagulation Factor II (thrombin) Receptor-like 3 (F2RL3, Accession NM\_003950), a gene which Protease-activated receptor 4; G protein-coupled receptor that increases phosphoinositide hydrolysis. Accordingly, utilities of VGAM760 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F2RL3. The function of F2RL3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM193.FLJ11029 (Accession XM\_027783) is another VGAM760 host target gene. FLJ11029 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ11029, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11029 BINDING SITE, designated SEQ ID:30569, to the nucleotide sequence of VGAM760 RNA, herein designated VGAM RNA, also designated SEQ ID:3471.

[29867] Another function of VGAM760 is therefore inhibition of FLJ11029 (Accession XM\_027783). Accordingly, utilities of VGAM760 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11029. FLJ21168 (Accession NM\_025073) is another VGAM760 host target gene. FLJ21168 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21168, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21168 BINDING SITE, designated SEQ ID:24674, to the nucleotide sequence of VGAM760 RNA, herein designated VGAM RNA, also designated SEQ ID:3471.

[29868] Another function of VGAM760 is therefore inhibition of FLJ21168 (Accession NM\_025073). Accordingly, utilities of VGAM760 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FLJ21168. Guanine Nucleotide Binding Protein (G protein), Gamma 10 (GNG10, Accession NM\_004125) is another VGAM760 host target gene. GNG10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GNG10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GNG10 BINDING SITE, designated SEQ ID:10332, to the nucleotide sequence of VGAM760 RNA, herein designated VGAM RNA, also designated SEQ ID:3471.

[29869] Another function of VGAM760 is therefore inhibition of Guanine Nucleotide Binding Protein (G protein), Gamma 10 (GNG10, Accession NM\_004125). Accordingly, utilities of VGAM760 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNG10. GR6 (Accession NM\_007354) is another VGAM760 host target gene. GR6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GR6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of GR6 BINDING SITE, designated SEQ ID:14283, to the nucleotide sequence of VGAM760 RNA, herein designated VGAM RNA, also designated SEQ ID:3471.

[29870] Another function of VGAM760 is therefore inhibition of GR6 (Accession NM\_007354). Accordingly, utilities of VGAM760 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GR6. HBOA (Accession NM\_007067) is another VGAM760 host target gene. HBOA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HBOA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HBOA BINDING SITE, designated SEQ ID:13931, to the nucleotide sequence of VGAM760 RNA, herein designated VGAM RNA, also designated SEQ ID:3471.

[29871] Another function of VGAM760 is therefore inhibition of HBOA (Accession NM\_007067). Accordingly, utilities of VGAM760 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HBOA. KIAA0319 (Accession NM\_014809) is another VGAM760

host target gene. KIAA0319 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0319, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0319 BINDING SITE, designated SEQ ID:16766, to the nucleotide sequence of VGAM760 RNA, herein designated VGAM RNA, also designated SEQ ID:3471.

[29872] Another function of VGAM760 is therefore inhibition of KIAA0319 (Accession NM\_014809). Accordingly, utilities of VGAM760 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0319. KIAA0472 (Accession XM\_050147) is another VGAM760 host target gene. KIAA0472 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0472, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0472 BINDING SITE, designated SEQ ID:35576, to the nucleotide sequence of VGAM760 RNA, herein designated VGAM RNA, also designated SEQ ID:3471.

[29873] Another function of VGAM760 is therefore inhibition of KIAA0472 (Accession XM\_050147). Accordingly, utilities of VGAM760 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0472. PAS Domain Containing Serine/threonine Kinase (PASK, Accession NM\_015148) is another VGAM760 host target gene. PASK BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PASK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PASK BINDING SITE, designated SEQ ID:17502, to the nucleotide sequence of VGAM760 RNA, herein designated VGAM RNA, also designated SEQ ID:3471.

[29874] Another function of VGAM760 is therefore inhibition of PAS Domain Containing Serine/threonine Kinase (PASK, Accession NM\_015148). Accordingly, utilities of VGAM760 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PASK. LOC220883 (Accession XM\_166076) is another VGAM760 host target gene. LOC220883 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded

by LOC220883, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220883 BINDING SITE, designated SEQ ID:43852, to the nucleotide sequence of VGAM760 RNA, herein designated VGAM RNA, also designated SEQ ID:3471.

[29875] Another function of VGAM760 is therefore inhibition of LOC220883 (Accession XM\_166076). Accordingly, utilities of VGAM760 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220883. LOC221662 (Accession XM\_166466) is another VGAM760 host target gene. LOC221662 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221662, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221662 BINDING SITE, designated SEQ ID:44390, to the nucleotide sequence of VGAM760 RNA, herein designated VGAM RNA, also designated SEQ ID:3471.

[29876] Another function of VGAM760 is therefore inhibition of LOC221662 (Accession XM\_166466). Accordingly, utilities

of VGAM760 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221662. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 761 (VGAM761) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29877] VGAM761 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM761 was detected is described hereinabove with reference to Figs. 1–8.

[29878] VGAM761 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Coronavirus. VGAM761 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29879] VGAM761 gene encodes a VGAM761 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM761 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide se–

quence of VGAM761 precursor RNA is designated SEQ ID:747, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:747 is located at position 5511 relative to the genome of Bovine Coronavirus.

[29880] VGAM761 precursor RNA folds onto itself, forming VGAM761 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29881] An enzyme complex designated DICER COMPLEX, `dices` the VGAM761 folded precursor RNA into VGAM761 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 57%) nucleotide sequence of VGAM761 RNA is designated SEQ ID:3472, and

is provided hereinbelow with reference to the sequence listing part.

[29882] VGAM761 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM761 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM761 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[29883] VGAM761 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM761 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM761 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM761 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM761 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[29884] The complementary binding of VGAM761 RNA, herein designated VGAM RNA, to host target binding sites on VGAM761 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM761 host target RNA into VGAM761 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29885] It is appreciated that VGAM761 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM761 host target genes. The mRNA of each one of this plurality of VGAM761 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM761 RNA, herein designated VGAM RNA, and which when bound by VGAM761 RNA causes inhibition of translation of respective one or more VGAM761 host target proteins.

[29886] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM761 gene, herein designated VGAM GENE, on one or more VGAM761 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[29887] It is yet further appreciated that a function of VGAM761 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM761 include diagnosis, prevention and treatment of viral infection by Bovine Coronavirus. Specific functions, and accordingly utilities, of VGAM761 correlate with, and may be deduced from, the identity of the host target genes which VGAM761 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29888] Nucleotide sequences of the VGAM761 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM761 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM761 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM761 are further described hereinbelow with reference to Table 1.

[29889] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM761 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM761 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29890] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM761 gene, herein designated VGAM is inhibition of expression of VGAM761 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM761 correlate with, and may be deduced from, the identity of the target genes which VGAM761 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29891] GTP Binding Protein 5 (putative) (GTPBP5, Accession XM\_037206) is a VGAM761 host target gene. GTPBP5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GTPBP5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GTPBP5 BINDING SITE, designated SEQ ID:32575, to the nucleotide sequence of VGAM761 RNA, herein designated VGAM RNA, also designated SEQ ID:3472.

[29892] A function of VGAM761 is therefore inhibition of GTP Binding Protein 5 (putative) (GTPBP5, Accession XM\_037206). Accordingly, utilities of VGAM761 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GTPBP5. KIAA0625 (Accession NM\_015046) is another VGAM761 host target

gene. KIAA0625 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0625, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0625 BINDING SITE, designated SEQ ID:17407, to the nucleotide sequence of VGAM761 RNA, herein designated VGAM RNA, also designated SEQ ID:3472.

[29893] Another function of VGAM761 is therefore inhibition of KIAA0625 (Accession NM\_015046). Accordingly, utilities of VGAM761 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0625. KIAA1493 (Accession XM\_034415) is another VGAM761 host target gene. KIAA1493 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1493, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1493 BINDING SITE, designated SEQ ID:32087, to the nucleotide sequence of VGAM761 RNA, herein designated VGAM RNA, also designated SEQ ID:3472.

[29894] Another function of VGAM761 is therefore inhibition of KIAA1493 (Accession XM\_034415). Accordingly, utilities of VGAM761 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1493. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 762 (VGAM762) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29895] VGAM762 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM762 was detected is described hereinabove with reference to Figs. 1–8.

[29896] VGAM762 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Coronavirus. VGAM762 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29897] VGAM762 gene encodes a VGAM762 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM762

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM762 precursor RNA is designated SEQ ID:748, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:748 is located at position 3576 relative to the genome of Bovine Coronavirus.

[29898] VGAM762 precursor RNA folds onto itself, forming VGAM762 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29899] An enzyme complex designated DICER COMPLEX, `dices` the VGAM762 folded precursor RNA into VGAM762 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 53%) nucleotide sequence of VGAM762 RNA is designated SEQ ID:3473, and is provided hereinbelow with reference to the sequence listing part.

[29900] VGAM762 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM762 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM762 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[29901] VGAM762 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM762 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM762 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM762 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM762 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[29902] The complementary binding of VGAM762 RNA, herein designated VGAM RNA, to host target binding sites on VGAM762 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM762 host target RNA into VGAM762 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29903] It is appreciated that VGAM762 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM762 host target genes. The mRNA of each one of this plurality of VGAM762 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM762 RNA, herein designated VGAM RNA, and which when bound by VGAM762 RNA causes inhibition of translation of respective one or more VGAM762 host target proteins.

[29904] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM762 gene, herein designated VGAM GENE, on one or more VGAM762 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[29905] It is yet further appreciated that a function of VGAM762 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM762 include diagnosis, prevention and treatment of viral infection by Bovine Coronavirus. Specific functions, and accordingly utilities, of VGAM762 correlate with, and may be deduced from, the identity of the host target genes which VGAM762 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29906] Nucleotide sequences of the VGAM762 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM762 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM762 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM762 are further described hereinbelow with reference to Table 1.

[29907] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM762 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM762 RNA, herein designated VGAM RNA, are described hereinbelow with refer-

ence to Table 2.

[29908] As mentioned hereinabove with reference to Fig. 1, a function of VGAM762 gene, herein designated VGAM is inhibition of expression of VGAM762 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM762 correlate with, and may be deduced from, the identity of the target genes which VGAM762 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29909] Apolipoprotein B mRNA Editing Enzyme, Catalytic Polypeptide 1 (APOBEC1, Accession NM\_005889) is a VGAM762 host target gene. APOBEC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by APOBEC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APOBEC1 BINDING SITE, designated SEQ ID:12510, to the nucleotide sequence of VGAM762 RNA, herein designated VGAM RNA, also designated SEQ ID:3473.

[29910] A function of VGAM762 is therefore inhibition of Apolipoprotein B mRNA Editing Enzyme, Catalytic Polypeptide 1 (APOBEC1, Accession NM\_005889). Accord-

ingly, utilities of VGAM762 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APOBEC1. Chloride Channel 4 (CLCN4, Accession NM\_001830) is another VGAM762 host target gene. CLCN4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLCN4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLCN4 BINDING SITE, designated SEQ ID:7570, to the nucleotide sequence of VGAM762 RNA, herein designated VGAM RNA, also designated SEQ ID:3473.

[29911] Another function of VGAM762 is therefore inhibition of Chloride Channel 4 (CLCN4, Accession NM\_001830), a gene which is regulation of cell volume; membrane potential stabilization, signal transduction and transepithelial transport. Accordingly, utilities of VGAM762 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLCN4. The function of CLCN4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM558.Protocadherin Alpha 1 (PCDHA1, Accession NM\_018900) is another VGAM762 host target gene.

PCDHA1 BINDING SITE1 and PCDHA1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCDHA1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA1 BINDING SITE1 and PCDHA1 BINDING SITE2, designated SEQ ID:20868 and SEQ ID:25387 respectively, to the nucleotide sequence of VGAM762 RNA, herein designated VGAM RNA, also designated SEQ ID:3473.

[29912] Another function of VGAM762 is therefore inhibition of Protocadherin Alpha 1 (PCDHA1, Accession NM\_018900). Accordingly, utilities of VGAM762 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA1. Protocadherin Alpha 10 (PCDHA10, Accession NM\_031860) is another VGAM762 host target gene. PCDHA10 BINDING SITE1 and PCDHA10 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCDHA10, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of PCDHA10 BINDING SITE1 and PCDHA10 BINDING SITE2, designated SEQ ID:25619 and SEQ ID:20889 respectively, to the nucleotide sequence of VGAM762 RNA, herein designated VGAM RNA, also designated SEQ ID:3473.

[29913] Another function of VGAM762 is therefore inhibition of Protocadherin Alpha 10 (PCDHA10, Accession NM\_031860). Accordingly, utilities of VGAM762 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA10. Protocadherin Alpha 13 (PCDHA13, Accession NM\_018904) is another VGAM762 host target gene. PCDHA13 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHA13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA13 BINDING SITE, designated SEQ ID:20909, to the nucleotide sequence of VGAM762 RNA, herein designated VGAM RNA, also designated SEQ ID:3473.

[29914] Another function of VGAM762 is therefore inhibition of Protocadherin Alpha 13 (PCDHA13, Accession NM\_018904). Accordingly, utilities of VGAM762 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA13. Protocadherin Alpha 2 (PCDHA2, Accession NM\_018905) is another VGAM762 host target gene. PCDHA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA2 BINDING SITE, designated SEQ ID:20919, to the nucleotide sequence of VGAM762 RNA, herein designated VGAM RNA, also designated SEQ ID:3473.

[29915] Another function of VGAM762 is therefore inhibition of Protocadherin Alpha 2 (PCDHA2, Accession NM\_018905). Accordingly, utilities of VGAM762 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA2. Protocadherin Alpha 3 (PCDHA3, Accession NM\_018906) is another VGAM762 host target gene. PCDHA3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of PCDHA3 BINDING SITE, designated SEQ ID:20929, to the nucleotide sequence of VGAM762 RNA, herein designated VGAM RNA, also designated SEQ ID:3473.

[29916] Another function of VGAM762 is therefore inhibition of Protocadherin Alpha 3 (PCDHA3, Accession NM\_018906). Accordingly, utilities of VGAM762 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA3. Protocadherin Alpha 4 (PCDHA4, Accession NM\_018907) is another VGAM762 host target gene. PCDHA4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA4 BINDING SITE, designated SEQ ID:20939, to the nucleotide sequence of VGAM762 RNA, herein designated VGAM RNA, also designated SEQ ID:3473.

[29917] Another function of VGAM762 is therefore inhibition of Protocadherin Alpha 4 (PCDHA4, Accession NM\_018907). Accordingly, utilities of VGAM762 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with PCDHA4. Protocadherin Alpha 5 (PCDHA5, Accession NM\_018908) is another VGAM762 host target gene. PCDHA5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHA5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA5 BINDING SITE, designated SEQ ID:20949, to the nucleotide sequence of VGAM762 RNA, herein designated VGAM RNA, also designated SEQ ID:3473.

[29918] Another function of VGAM762 is therefore inhibition of Protocadherin Alpha 5 (PCDHA5, Accession NM\_018908). Accordingly, utilities of VGAM762 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA5. Protocadherin Alpha 6 (PCDHA6, Accession NM\_018909) is another VGAM762 host target gene. PCDHA6 BINDING SITE1 and PCDHA6 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCDHA6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA6

BINDING SITE1 and PCDHA6 BINDING SITE2, designated SEQ ID:20959 and SEQ ID:25591 respectively, to the nucleotide sequence of VGAM762 RNA, herein designated VGAM RNA, also designated SEQ ID:3473.

[29919] Another function of VGAM762 is therefore inhibition of Protocadherin Alpha 6 (PCDHA6, Accession NM\_018909). Accordingly, utilities of VGAM762 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA6. Protocadherin Alpha 8 (PCDHA8, Accession NM\_018911) is another VGAM762 host target gene. PCDHA8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHA8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA8 BINDING SITE, designated SEQ ID:20979, to the nucleotide sequence of VGAM762 RNA, herein designated VGAM RNA, also designated SEQ ID:3473.

[29920] Another function of VGAM762 is therefore inhibition of Protocadherin Alpha 8 (PCDHA8, Accession NM\_018911). Accordingly, utilities of VGAM762 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with PCDHA8. Protocadherin Alpha 9 (PCDHA9, Accession NM\_031857) is another VGAM762 host target gene. PCDHA9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHA9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA9 BINDING SITE, designated SEQ ID:25605, to the nucleotide sequence of VGAM762 RNA, herein designated VGAM RNA, also designated SEQ ID:3473.

[29921] Another function of VGAM762 is therefore inhibition of Protocadherin Alpha 9 (PCDHA9, Accession NM\_031857), a gene which is a calcium-dependent cell-adhesion protein. Accordingly, utilities of VGAM762 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA9. The function of PCDHA9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM71. Protocadherin Alpha Subfamily C, 1 (PCDHAC1, Accession NM\_018898) is another VGAM762 host target gene. PCDHAC1 BINDING SITE is HOST TARGET binding

site found in the 3` untranslated region of mRNA encoded by PCDHAC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHAC1 BINDING SITE, designated SEQ ID:20848, to the nucleotide sequence of VGAM762 RNA, herein designated VGAM RNA, also designated SEQ ID:3473.

[29922] Another function of VGAM762 is therefore inhibition of Protocadherin Alpha Subfamily C, 1 (PCDHAC1, Accession NM\_018898). Accordingly, utilities of VGAM762 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHAC1. Protocadherin Alpha Subfamily C, 2 (PCDHAC2, Accession NM\_018899) is another VGAM762 host target gene. PCDHAC2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PCDHAC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHAC2 BINDING SITE, designated SEQ ID:20858, to the nucleotide sequence of VGAM762 RNA, herein designated VGAM RNA, also designated SEQ ID:3473.

[29923] Another function of VGAM762 is therefore inhibition of Protocadherin Alpha Subfamily C, 2 (PCDHAC2, Accession NM\_018899). Accordingly, utilities of VGAM762 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHAC2. Calmodulin Binding Transcription Activator 1 (CAMTA1, Accession XM\_042323) is another VGAM762 host target gene. CAMTA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAMTA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAMTA1 BINDING SITE, designated SEQ ID:33718, to the nucleotide sequence of VGAM762 RNA, herein designated VGAM RNA, also designated SEQ ID:3473.

[29924] Another function of VGAM762 is therefore inhibition of Calmodulin Binding Transcription Activator 1 (CAMTA1, Accession XM\_042323). Accordingly, utilities of VGAM762 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAMTA1. FLJ12121 (Accession NM\_024978) is another VGAM762 host target gene. FLJ12121 BINDING SITE is HOST TARGET binding

site found in the 3' untranslated region of mRNA encoded by FLJ12121, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12121 BINDING SITE, designated SEQ ID:24537, to the nucleotide sequence of VGAM762 RNA, herein designated VGAM RNA, also designated SEQ ID:3473.

[29925] Another function of VGAM762 is therefore inhibition of FLJ12121 (Accession NM\_024978). Accordingly, utilities of VGAM762 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12121. KIAA0329 (Accession NM\_014844) is another VGAM762 host target gene. KIAA0329 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0329, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0329 BINDING SITE, designated SEQ ID:16876, to the nucleotide sequence of VGAM762 RNA, herein designated VGAM RNA, also designated SEQ ID:3473.

[29926] Another function of VGAM762 is therefore inhibition of

KIAA0329 (Accession NM\_014844). Accordingly, utilities of VGAM762 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0329. KIAA0390 (Accession NM\_014717) is another VGAM762 host target gene. KIAA0390 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0390, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0390 BINDING SITE, designated SEQ ID:16269, to the nucleotide sequence of VGAM762 RNA, herein designated VGAM RNA, also designated SEQ ID:3473.

[29927] Another function of VGAM762 is therefore inhibition of KIAA0390 (Accession NM\_014717). Accordingly, utilities of VGAM762 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0390. KIAA1550 (Accession XM\_039393) is another VGAM762 host target gene. KIAA1550 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1550, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1550 BINDING SITE, designated SEQ ID:33071, to the nucleotide sequence of VGAM762 RNA, herein designated VGAM RNA, also designated SEQ ID:3473.

[29928] Another function of VGAM762 is therefore inhibition of KIAA1550 (Accession XM\_039393). Accordingly, utilities of VGAM762 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1550. Methyl-CpG Binding Domain Protein 2 (MBD2, Accession NM\_015832) is another VGAM762 host target gene. MBD2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MBD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MBD2 BINDING SITE, designated SEQ ID:17946, to the nucleotide sequence of VGAM762 RNA, herein designated VGAM RNA, also designated SEQ ID:3473.

[29929] Another function of VGAM762 is therefore inhibition of Methyl-CpG Binding Domain Protein 2 (MBD2, Accession NM\_015832). Accordingly, utilities of VGAM762 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MBD2. Signaling Lympho-

cytic Activation Molecule (SLAM, Accession NM\_003037) is another VGAM762 host target gene. SLAM BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLAM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLAM BINDING SITE, designated SEQ ID:8992, to the nucleotide sequence of VGAM762 RNA, herein designated VGAM RNA, also designated SEQ ID:3473.

[29930] Another function of VGAM762 is therefore inhibition of Signaling Lymphocytic Activation Molecule (SLAM, Accession NM\_003037). Accordingly, utilities of VGAM762 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLAM. LOC118851 (Accession XM\_061180) is another VGAM762 host target gene. LOC118851 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC118851, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC118851 BINDING SITE, designated SEQ ID:37200, to the nucleotide sequence of

VGAM762 RNA, herein designated VGAM RNA, also designated SEQ ID:3473.

[29931] Another function of VGAM762 is therefore inhibition of LOC118851 (Accession XM\_061180). Accordingly, utilities of VGAM762 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC118851. LOC146890 (Accession XM\_097128) is another VGAM762 host target gene. LOC146890 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146890, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146890 BINDING SITE, designated SEQ ID:40764, to the nucleotide sequence of VGAM762 RNA, herein designated VGAM RNA, also designated SEQ ID:3473.

[29932] Another function of VGAM762 is therefore inhibition of LOC146890 (Accession XM\_097128). Accordingly, utilities of VGAM762 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146890. LOC157627 (Accession XM\_088347) is another VGAM762 host target gene. LOC157627 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC157627, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157627 BINDING SITE, designated SEQ ID:39621, to the nucleotide sequence of VGAM762 RNA, herein designated VGAM RNA, also designated SEQ ID:3473.

[29933] Another function of VGAM762 is therefore inhibition of LOC157627 (Accession XM\_088347). Accordingly, utilities of VGAM762 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157627. LOC163682 (Accession XM\_099402) is another VGAM762 host target gene. LOC163682 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC163682, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163682 BINDING SITE, designated SEQ ID:42093, to the nucleotide sequence of VGAM762 RNA, herein designated VGAM RNA, also designated SEQ ID:3473.

[29934] Another function of VGAM762 is therefore inhibition of LOC163682 (Accession XM\_099402). Accordingly, utilities

of VGAM762 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163682. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 763 (VGAM763) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29935] VGAM763 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM763 was detected is described hereinabove with reference to Figs. 1–8.

[29936] VGAM763 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Coronavirus. VGAM763 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29937] VGAM763 gene encodes a VGAM763 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM763 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide se–

quence of VGAM763 precursor RNA is designated SEQ ID:749, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:749 is located at position 18582 relative to the genome of Bovine Coronavirus.

[29938] VGAM763 precursor RNA folds onto itself, forming VGAM763 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29939] An enzyme complex designated DICER COMPLEX, `dices` the VGAM763 folded precursor RNA into VGAM763 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM763 RNA is designated SEQ ID:3474, and

is provided hereinbelow with reference to the sequence listing part.

[29940] VGAM763 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM763 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM763 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[29941] VGAM763 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM763 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM763 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM763 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM763 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[29942] The complementary binding of VGAM763 RNA, herein designated VGAM RNA, to host target binding sites on VGAM763 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM763 host target RNA into VGAM763 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29943] It is appreciated that VGAM763 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM763 host target genes. The mRNA of each one of this plurality of VGAM763 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM763 RNA, herein designated VGAM RNA, and which when bound by VGAM763 RNA causes inhibition of translation of respective one or more VGAM763 host target proteins.

[29944] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM763 gene, herein designated VGAM GENE, on one or more VGAM763 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[29945] It is yet further appreciated that a function of VGAM763 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM763 include diagnosis, prevention and treatment of viral infection by Bovine Coronavirus. Specific functions, and accordingly utilities, of VGAM763 correlate with, and may be deduced from, the identity of the host target genes which VGAM763 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29946] Nucleotide sequences of the VGAM763 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM763 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM763 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM763 are further described hereinbelow with reference to Table 1.

[29947] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM763 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM763 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29948] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM763 gene, herein designated VGAM is inhibition of expression of VGAM763 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM763 correlate with, and may be deduced from, the identity of the target genes which VGAM763 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29949] MCF.2 Cell Line Derived Transforming Sequence (MCF2, Accession NM\_005369) is a VGAM763 host target gene. MCF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MCF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MCF2 BINDING SITE, designated SEQ ID:11840, to the nucleotide sequence of VGAM763 RNA, herein designated VGAM RNA, also designated SEQ ID:3474.

[29950] A function of VGAM763 is therefore inhibition of MCF.2 Cell Line Derived Transforming Sequence (MCF2, Accession NM\_005369), a gene which Cytoplasmic oncoprotein similar to vimentin. Accordingly, utilities of VGAM763 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MCF2. The function of

MCF2 has been established by previous studies. MCF2 is the designation of a transforming sequence identified using cotransfection of DNA from a human mammary carcinoma cell line. Noguchi et al. (1987) cloned this sequence and found that it did not cross-hybridize with the known oncogenes tested. By in situ hybridization, Noguchi et al. (1987) localized it to Xq27. This localization was confirmed by hybridization to DNA from a panel of human-rodent somatic cell hybrid lines. By pulsed field gel electrophoresis, Nguyen et al. (1987) found that the MCF2 gene and the F9 gene (OMIM Ref. No. 306900) are separated by a maximum distance of about 270 kb. Furthermore, they located several HTF islands in this region, i.e., CpG-rich, unmethylated sequences, containing several sites for 'rare cutter' enzymes, which are believed to be associated with expressed 'housekeeping' genes. Anson et al. (1988) further narrowed the interval separating MCF2 and F9, locating MCF2 to a region between 29 and 61 kb 3-prime to F9. In 2 unrelated hemophilia B (OMIM Ref. No. 306900) patients who raised antibodies to infused factor IX, they found deletions in excess of 273 kb encompassing the F9 and MCF2 genes and a CG-rich island. This appears to have been the first reported nullisomic deletion

of a transforming gene. No clinical condition could be attributed to the loss of the MCF2 gene. The CG-rich island may be a marker for an as yet undefined gene lying just 5-prime or just 3-prime off the island. Nguyen et al. (1989) concluded from pulsed field gel electrophoresis studies of the Xq27 region that MCF2 is located telomeric to F9. Grant et al. (1990) demonstrated that Mcf-2 in the mouse lies in the same order as the corresponding gene on the human X chromosome: Hprt--Cf-9--Mcf-2--G6pd. In situ hybridization indicated that the gene lies in the same region as Cf-9 and linkage studies in interspecific mouse backcross populations demonstrated that the Cf-9 and Mcf-2 genes were separated by about 0.5 cM. A comparison of the restriction maps of the DBL and MCF2 oncogenes, together with their chromosomal localization, indicates that they represent the same genetic locus. The DBL oncogene was initially detected as a transforming gene from a human diffuse B-cell lymphoma and was isolated as a 45-kb transforming human DNA sequence by cosmid cloning (Eva and Aaronson, 1985). By molecular hybridization, DBL lacks detectable homology with a large number of cellular or retroviral oncogenes, including members of the tyrosine kinase

family. Srivastava et al. (1986) demonstrated that anti-serum from mice bearing tumors induced by this onco-gene specifically detected a protein of about 66 kD in DBL transformants. Using DBL cDNA, they isolated mRNA from a transfectant clone and found that it directed the in vitro synthesis of this protein. Subcellular localization studies showed that the protein, also known as p66, is a cytoplasmic protein distributed between cytosol and crude membrane fractions. They showed, furthermore, that p66 is a phosphoprotein, with phosphorylation specific to serine residues. Ron et al. (1988) showed that overexpression of DBL is sufficient to transform NIH 3T3 cells. Ron et al. (1988) cloned and characterized the DBL oncogene. The DBL oncogene was generated by rearrangements involving 3 discontinuous regions of the human genome. By analysis of DNA from human/rodent somatic cell hybrids, Tronick et al. (1989) demonstrated that the DBL gene located on the X chromosome underwent recombination at its 5-prime and 3-prime ends with sequences derived from chromosomes 3 (pter-p21) and 16 (p13-q22), respectively. By in situ hybridization, Tronick et al. (1989) located the DBL gene more precisely to Xq27. Oncogenic activation of the MCF2 gene occurs through substitution

of part of its 5-prime coding region by unrelated nonsyn-  
tenic sequences. Galland et al. (1992) demonstrated that  
the upstream replacing sequence, referred to as URS, rep-  
resents the farthest 5-prime portion of the locus and that  
it is derived from the D15S93 locus on human chromo-  
some 15q15-q23.

[29951] Full details of the abovementioned studies are described  
in the following publications, the disclosure of which are  
hereby incorporated by reference:

[29954] Further studies establishing the function and utilities of  
MCF2 are found in John Hopkins OMIM database record ID  
311030, and in cited publications numbered 1139 and  
8618-8626 listed in the bibliography section hereinbelow,  
which are also hereby incorporated by refer-

ence.KIAA0293 (Accession XM\_027045) is another VGAM763 host target gene. KIAA0293 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0293, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0293 BINDING SITE, designated SEQ ID:30392, to the nucleotide sequence of VGAM763 RNA, herein designated VGAM RNA, also designated SEQ ID:3474.

[29955] Another function of VGAM763 is therefore inhibition of KIAA0293 (Accession XM\_027045). Accordingly, utilities of VGAM763 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0293. LOC91664 (Accession XM\_039908) is another VGAM763 host target gene. LOC91664 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC91664, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91664 BINDING SITE, designated SEQ ID:33211, to the nucleotide sequence of VGAM763 RNA, herein designated

VGAM RNA, also designated SEQ ID:3474.

[29956] Another function of VGAM763 is therefore inhibition of LOC91664 (Accession XM\_039908). Accordingly, utilities of VGAM763 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91664. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 764 (VGAM764) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29957] VGAM764 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM764 was detected is described hereinabove with reference to Figs. 1–8.

[29958] VGAM764 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Coronavirus. VGAM764 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29959] VGAM764 gene encodes a VGAM764 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM764 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM764 precursor RNA is designated SEQ ID:750, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:750 is located at position 11280 relative to the genome of Bovine Coronavirus.

[29960] VGAM764 precursor RNA folds onto itself, forming VGAM764 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29961] An enzyme complex designated DICER COMPLEX, `dices` the VGAM764 folded precursor RNA into VGAM764 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 51%) nucleotide sequence of VGAM764 RNA is designated SEQ ID:3475, and is provided hereinbelow with reference to the sequence listing part.

[29962] VGAM764 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM764 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM764 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[29963] VGAM764 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM764 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM764 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM764 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM764 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[29964] The complementary binding of VGAM764 RNA, herein designated VGAM RNA, to host target binding sites on VGAM764 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM764 host target RNA into VGAM764 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29965] It is appreciated that VGAM764 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM764 host target genes. The mRNA of

each one of this plurality of VGAM764 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM764 RNA, herein designated VGAM RNA, and which when bound by VGAM764 RNA causes inhibition of translation of respective one or more VGAM764 host target proteins.

[29966] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM764 gene, herein designated VGAM GENE, on one or more VGAM764 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[29967] It is yet further appreciated that a function of VGAM764 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM764 include diagnosis, prevention and treatment of viral infection by Bovine Coronavirus. Specific functions, and accordingly utilities, of VGAM764 correlate with, and may be deduced from, the identity of the host target genes which VGAM764 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29968] Nucleotide sequences of the VGAM764 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM764 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM764 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM764 are further described hereinbelow with reference to Table 1.

[29969] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM764 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM764 RNA, herein desig-

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[29970] As mentioned hereinabove with reference to Fig. 1, a function of VGAM764 gene, herein designated VGAM is inhibition of expression of VGAM764 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM764 correlate with, and may be deduced from, the identity of the target genes which VGAM764 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29971] Chromosome 21 Open Reading Frame 25 (C21orf25, Accession XM\_032945) is a VGAM764 host target gene. C21orf25 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C21orf25, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C21orf25 BINDING SITE, designated SEQ ID:31794, to the nucleotide sequence of VGAM764 RNA, herein designated VGAM RNA, also designated SEQ ID:3475.

[29972] A function of VGAM764 is therefore inhibition of Chromosome 21 Open Reading Frame 25 (C21orf25, Accession

XM\_032945). Accordingly, utilities of VGAM764 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C21orf25. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 765 (VGAM765) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29973] VGAM765 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM765 was detected is described hereinabove with reference to Figs. 1–8.

[29974] VGAM765 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Coronavirus. VGAM765 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29975] VGAM765 gene encodes a VGAM765 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM765 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide se–

quence of VGAM765 precursor RNA is designated SEQ ID:751, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:751 is located at position 8100 relative to the genome of Bovine Coronavirus.

[29976] VGAM765 precursor RNA folds onto itself, forming VGAM765 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29977] An enzyme complex designated DICER COMPLEX, `dices` the VGAM765 folded precursor RNA into VGAM765 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM765 RNA is designated SEQ ID:3476, and

is provided hereinbelow with reference to the sequence listing part.

[29978] VGAM765 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM765 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM765 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[29979] VGAM765 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM765 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM765 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM765 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM765 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[29980] The complementary binding of VGAM765 RNA, herein designated VGAM RNA, to host target binding sites on VGAM765 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM765 host target RNA into VGAM765 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[29981] It is appreciated that VGAM765 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM765 host target genes. The mRNA of each one of this plurality of VGAM765 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM765 RNA, herein designated VGAM RNA, and which when bound by VGAM765 RNA causes inhibition of translation of respective one or more VGAM765 host target proteins.

[29982] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM765 gene, herein designated VGAM GENE, on one or more VGAM765 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[29983] It is yet further appreciated that a function of VGAM765 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM765 include diagnosis, prevention and treatment of viral infection by Bovine Coronavirus. Specific functions, and accordingly utilities, of VGAM765 correlate with, and may be deduced from, the identity of the host target genes which VGAM765 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[29984] Nucleotide sequences of the VGAM765 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM765 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM765 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM765 are further described hereinbelow with reference to Table 1.

[29985] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM765 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM765 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[29986] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM765 gene, herein designated VGAM is inhibition of expression of VGAM765 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM765 correlate with, and may be deduced from, the identity of the target genes which VGAM765 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[29987] Potassium Inwardly-rectifying Channel, Subfamily J, Member 16 (KCNJ16, Accession NM\_018658) is a VGAM765 host target gene. KCNJ16 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KCNJ16, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNJ16 BINDING SITE, designated SEQ ID:20727, to the nucleotide sequence of VGAM765 RNA, herein designated VGAM RNA, also designated SEQ ID:3476.

[29988] A function of VGAM765 is therefore inhibition of Potassium Inwardly-rectifying Channel, Subfamily J, Member 16 (KCNJ16, Accession NM\_018658). Accordingly, utilities of VGAM765 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNJ16.

CG005 (Accession NM\_014887) is another VGAM765 host target gene. CG005 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CG005, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CG005 BINDING SITE, designated SEQ ID:17038, to the nucleotide sequence of VGAM765 RNA, herein designated VGAM RNA, also designated SEQ ID:3476.

[29989] Another function of VGAM765 is therefore inhibition of CG005 (Accession NM\_014887). Accordingly, utilities of VGAM765 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CG005. LOC219401 (Accession XM\_166706) is another VGAM765 host target gene. LOC219401 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219401, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219401 BINDING SITE, designated SEQ ID:44584, to the nucleotide sequence of VGAM765 RNA, herein designated VGAM RNA,

also designated SEQ ID:3476.

[29990] Another function of VGAM765 is therefore inhibition of LOC219401 (Accession XM\_166706). Accordingly, utilities of VGAM765 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219401. LOC90462 (Accession XM\_031852) is another VGAM765 host target gene. LOC90462 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90462, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90462 BINDING SITE, designated SEQ ID:31503, to the nucleotide sequence of VGAM765 RNA, herein designated VGAM RNA, also designated SEQ ID:3476.

[29991] Another function of VGAM765 is therefore inhibition of LOC90462 (Accession XM\_031852). Accordingly, utilities of VGAM765 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90462. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 766 (VGAM766) viral gene, which modu-

lates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[29992] VGAM766 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM766 was detected is described hereinabove with reference to Figs. 1–8.

[29993] VGAM766 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Coronavirus. VGAM766 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[29994] VGAM766 gene encodes a VGAM766 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM766 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM766 precursor RNA is designated SEQ ID:752, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:752 is located at position 8663 relative to the genome of Bovine Coronavirus.

[29995] VGAM766 precursor RNA folds onto itself, forming

VGAM766 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[29996] An enzyme complex designated DICER COMPLEX, `dices` the VGAM766 folded precursor RNA into VGAM766 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM766 RNA is designated SEQ ID:3477, and is provided hereinbelow with reference to the sequence listing part.

[29997] VGAM766 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM766 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM766 host target RNA comprises

three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[29998] VGAM766 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM766 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM766 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM766 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM766 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[29999] The complementary binding of VGAM766 RNA, herein designated VGAM RNA, to host target binding sites on VGAM766 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM766 host target RNA into VGAM766 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30000] It is appreciated that VGAM766 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM766 host target genes. The mRNA of each one of this plurality of VGAM766 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM766 RNA, herein designated VGAM RNA, and which when bound by VGAM766 RNA causes inhibition of translation of respective one or more VGAM766 host target proteins.

[30001] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM766 gene, herein designated VGAM GENE, on one or more VGAM766 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[30002] It is yet further appreciated that a function of VGAM766 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of viral infection by Bovine Coronavirus. Specific functions, and accordingly utilities, of VGAM766 correlate with, and may be deduced from, the identity of the host target genes which VGAM766 binds and inhibits, and the

function of these host target genes, as elaborated herein–below.

[30003] Nucleotide sequences of the VGAM766 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM766 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM766 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM766 are further described hereinbelow with reference to Table 1.

[30004] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM766 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM766 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30005] As mentioned hereinabove with reference to Fig. 1, a function of VGAM766 gene, herein designated VGAM is inhibition of expression of VGAM766 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM766 correlate with, and may be deduced from, the identity of the target genes which VGAM766 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[30006] Adenylate Kinase 1 (AK1, Accession NM\_000476) is a VGAM766 host target gene. AK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AK1 BINDING SITE, designated SEQ ID:6087, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30007] A function of VGAM766 is therefore inhibition of Adenylate Kinase 1 (AK1, Accession NM\_000476). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AK1. DMC1 Dosage Suppressor of Mck1 Homolog, Meiosis-specific Homologous Recombination (yeast) (DMC1, Accession NM\_007068) is another VGAM766 host target gene. DMC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DMC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of DMC1 BINDING SITE, designated SEQ ID:13933, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30008] Another function of VGAM766 is therefore inhibition of DMC1 Dosage Suppressor of Mck1 Homolog, Meiosis-specific Homologous Recombination (yeast) (DMC1, Accession NM\_007068). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DMC1. DXYS155E (Accession NM\_005088) is another VGAM766 host target gene. DXYS155E BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DXYS155E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DXYS155E BINDING SITE, designated SEQ ID:11540, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30009] Another function of VGAM766 is therefore inhibition of DXYS155E (Accession NM\_005088), a gene which may be involved in b-cell activation. may also be involved in sig-

nal transduction and gene regulation. Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DXYS155E. The function of DXYS155E has been established by previous studies. In the 2.6-megabase segment of the distal short arms of the X and Y chromosomes, called the pseudoautosomal region, Ellison et al. (1992) identified an expressed gene designated XE7. (See also 465000.) They reported the structure of the XE7 gene and its expression in various human tissues. The analysis of genomic and cDNA clones showed that alternative RNA splicing results in the production of 2 protein isoforms, one containing 385 amino acids and the other containing 695 residues. The smaller polypeptide is a truncated version of the larger and results from the inclusion of a cassette exon that has an in-frame stop codon. The XE7 gene appears to be ubiquitously expressed, and the production of both protein isoforms was predicted in each of the several tissues examined.

[30010] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[30011] Ellison, J.; Passage, M.; Yu, L.-C.; Yen, P.; Mohandas, T. K.;

Shapiro, L. : Directed isolation of human genes that escape X inactivation. *Somat. Cell Molec. Genet.* 18: 259–268, 1992. ; and

[30012] Ellison, J. W.; Ramos, C.; Yen, P. H.; Shapiro, L. J. : Structure and expression of the human pseudoautosomal gene XE7. *Hum. Molec. Genet.* 1: 691–696, 1992.

[30013] Further studies establishing the function and utilities of DXYS155E are found in John Hopkins OMIM database record ID 312095, and in cited publications numbered 2916–2917 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Fibronectin Leucine Rich Transmembrane Protein 2 (FLRT2, Accession NM\_013231) is another VGAM766 host target gene. FLRT2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLRT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLRT2 BINDING SITE, designated SEQ ID:14875, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30014] Another function of VGAM766 is therefore inhibition of Fi–

bronectin Leucine Rich Transmembrane Protein 2 (FLRT2, Accession NM\_013231), a gene which may have a function in cell adhesion and/or receptor signaling. Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLRT2. The function of FLRT2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM247. Histamine Receptor H1 (HRH1, Accession NM\_000861) is another VGAM766 host target gene. HRH1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HRH1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HRH1 BINDING SITE, designated SEQ ID:6525, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30015] Another function of VGAM766 is therefore inhibition of Histamine Receptor H1 (HRH1, Accession NM\_000861), a gene which stimulates the synthesis of inositol phosphate. Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with HRH1. The function of HRH1 has been established by previous studies. Histamine is a ubiquitous messenger molecule released from mast cells, enterochromaffin-like cells, and neurons. Its various actions are mediated by 3 pharmacologically defined receptors termed the H1, H2 (OMIM Ref. No. 142703), and H3 (OMIM Ref. No. 604525) receptors. The H1 receptor was the first member of this family to be pharmacologically defined with the design of selective antagonists, the 'anti-histamines,' which are used to treat allergic and inflammatory reactions. The H1 receptor is expressed by various peripheral tissues, such as smooth muscle, and by neurons in the brain, where histamine may be involved in the control of wakefulness, mood, and hormone secretion. Yamashita et al. (1991) cloned a bovine H1 receptor cDNA and established its nucleotide sequence. Its homology with the corresponding sequence of other receptors confirmed that it belongs to the superfamily of receptors coupled with G proteins with 7 putative transmembrane domains. In addition to their expression in neuronal, gastric, and muscular tissue, the G protein-coupled receptors HRH1 and HRH2 are also expressed on T-helper lymphocytes and trigger different intracellular events upon acti-

vation. Using flow cytometric analysis, Jutel et al. (2001) demonstrated that histamine binds more strongly to Th1 than to Th2 cells. Flow cytometry and RT-PCR analysis showed that HRH1 is predominantly expressed on Th1 cells in an IL3 (OMIM Ref. No. 147740)–upregulatable manner, while HRH2 is predominant on Th2 cells. Stimulation of naive, CD45RA+ (see OMIM Ref. No. 151460) T cells with IL12 (OMIM Ref. No. 161560) resulted in preferential expression of HRH1, but stimulation with IL4 (OMIM Ref. No. 147780) resulted in suppressed expression of HRH1, demonstrating that mature CD45RO+ Th1 and Th2 lymphocytes preferentially but not exclusively express HRH1 and HRH2, and that HRH1 and HRH2 are regulated by cytokines present in the immune environment. Histamine stimulation of Th1 cells resulted in significant calcium flux that could be blocked by an HRH1 antagonist, while stimulation of Th2 cells led to cAMP formation that could be blocked by an HRH2, but not an HRH1, antagonist. Furthermore, histamine enhanced Th1 but inhibited Th2 responses to anti-CD3. Histamine also enhanced peripheral blood mononuclear cell responses in sensitized individuals to a predominantly Th1 antigen, but suppressed responses to Th2 allergens. Animal model exper–

iments lend further support to the function of HRH1. Ma et al. (2002) noted that pertussis toxin (PTX) elicits a range of responses in mice, including sensitization to vasoactive amines (VAAS) and increased vascular permeability subsequent to PTX-induced changes in vascular endothelial cells. Susceptible mouse strains die from hypotensive and hypovolemic shock on vasoactive amine challenge, whereas resistant strains do not. This hypersensitivity is controlled by an autosomal dominant locus, designated Bphs, localized to mouse chromosome 6. Using positional cloning, Ma et al. (2002) linked the Bphs locus to Hrh1. Mice lacking Hrh1 were protected from VAAS hypersensitivity, as well as from experimental allergic encephalomyelitis and experimental autoimmune orchitis. Sequence analysis showed that leu263-to-pro (L263P), met313-to-val (M313V), and ser331-to-pro (S331P) polymorphisms were associated with resistance to vasoactive amine challenge. The authors concluded that these Hrh1 alleles control both the autoimmune T-cell and vascular responses regulated by histamine after PTX sensitization.

[30016] It is appreciated that the abovementioned animal model for HRH1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appre-

ciated from the publications sited hereinbelow.

[30017] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[30018] Jutel, M.; Watanabe, T.; Klunker, S.; Akdis, M.; Thomet, O. A. R.; Malolepszy, J.; Zak-Nejmark, T.; Koga, R.; Kobayashi, T.; Blaser, K.; Akdis, C. A. : Histamine regulates T-cell and antibody responses by differential expression of H1 and H2 receptors. Nature 413: 420-425, 2001. ; and

[30019] Ma, R. Z.; Gao, J.; Meeker, N. D.; Fillmore, P. D.; Tung, K. S. K.; Watanabe, T.; Zachary, J. F.; Offner, H.; Blankenhorn, E. P.; Teuscher, C. : Identification of Bphs, an autoimmune di.

[30020] Further studies establishing the function and utilities of HRH1 are found in John Hopkins OMIM database record ID 600167, and in sited publications numbered 790 and 7906-7908 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Hormonally Upregulated Neu-associated Kinase (HUNK, Accession NM\_014586) is another VGAM766 host target gene. HUNK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded

by HUNK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HUNK BINDING SITE, designated SEQ ID:15950, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30021] Another function of VGAM766 is therefore inhibition of Hormonally Upregulated Neu-associated Kinase (HUNK, Accession NM\_014586). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HUNK. Potassium Inwardly-rectifying Channel, Subfamily J, Member 5 (KCNJ5, Accession NM\_000890) is another VGAM766 host target gene. KCNJ5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KCNJ5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNJ5 BINDING SITE, designated SEQ ID:6588, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30022] Another function of VGAM766 is therefore inhibition of Potassium Inwardly-rectifying Channel, Subfamily J, Member 5 (KCNJ5, Accession NM\_000890), a gene which is a potassium inwardly-rectifying channel. Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNJ5. The function of KCNJ5 has been established by previous studies. Potassium channels inhibited by cytosolic ATP are found in a wide variety of tissues. Tucker et al. (1995) noted that in the pancreatic beta-cell, potassium channels play a critical role in the regulation of insulin secretion, and in smooth muscle they are responsible for hypoxic vasodilatation. Moreover, these channels are the targets for several important classes of therapeutic drugs, including the antidiabetic sulfonamides and the antihypertensive potassium channel openers. In the heart, as in other tissues, K(ATP) channels are thought to couple the membrane potential to the metabolic status of the cell, and these normally quiescent channels are activated during transient ischemic and hypoxic periods when they contribute to shortening of the cardiac action potential duration. Ashford et al. (1994) cloned the rat heart K(ATP) channel, thus enabling the isolation of the human ho-

molog. The primary structure of KATP1 placed it in the J subfamily of inwardly rectifying potassium channels (Bond et al., 1994), such as KCNJ2 (OMIM Ref. No. 600681) and KCNJ4 (OMIM Ref. No. 600504); thus, the human homolog was designated KCNJ5. Wickman et al. (1997) reported a partial sequence of human GIRK4. They used human/rodent somatic cell hybrids to localize the human gene to chromosome 11, consistent with previous studies that localized the gene to 11q23-ter. Wickman et al. (1997) cloned the mouse Girk4 gene. They showed that the gene is expressed almost exclusively in the mouse heart. Using interspecific backcross analysis, Wickman et al. (1997) mapped the mouse Girk4 gene to chromosome 9, consistent with the mapping to human chromosome 11.

[30023] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[30024] Ashford, M. L. J.; Bond, C. T.; Blair, T. A.; Adelman, J. P. : Cloning and functional expression of a rat heart KATP channel. *Nature* 370: 456-459, 1994. ; and

[30025] Bond, C. T.; Pessia, M.; Xia, X.-M.; Lagrutta, A.; Kavanaugh, M. P.; Adelman, J. P. : Cloning and expression of a family of inward rectifier potassium channels. *Receptors*

Channels 2: 183.

[30026] Further studies establishing the function and utilities of KCNJ5 are found in John Hopkins OMIM database record ID 600734, and in cited publications numbered 7511–7514 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Leptin (obesity homolog, mouse) (LEP, Accession NM\_000230) is another VGAM766 host target gene. LEP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LEP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LEP BINDING SITE, designated SEQ ID:5738, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30027] Another function of VGAM766 is therefore inhibition of Leptin (obesity homolog, mouse) (LEP, Accession NM\_000230). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LEP. Nucleoporin 62kDa (NUP62, Accession NM\_016553) is another VGAM766 host target gene. NUP62 BINDING SITE is HOST TARGET binding

site found in the 3` untranslated region of mRNA encoded by NUP62, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NUP62 BINDING SITE, designated SEQ ID:18628, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30028] Another function of VGAM766 is therefore inhibition of Nucleoporin 62kDa (NUP62, Accession NM\_016553). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUP62. Pim-1 Oncogene (PIM1, Accession XM\_165800) is another VGAM766 host target gene. PIM1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PIM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIM1 BINDING SITE, designated SEQ ID:43754, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30029] Another function of VGAM766 is therefore inhibition of

Pim-1 Oncogene (PIM1, Accession XM\_165800), a gene which is a protooncogene. Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIM1. The function of PIM1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM95. Src Family Associated Phosphoprotein 2 (SCAP2, Accession NM\_003930) is another VGAM766 host target gene. SCAP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCAP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCAP2 BINDING SITE, designated SEQ ID:10029, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30030] Another function of VGAM766 is therefore inhibition of Src Family Associated Phosphoprotein 2 (SCAP2, Accession NM\_003930), a gene which interacts with Src family protein tyrosine kinases and SLAP/FYB (SLA). Accordingly, utilities of VGAM766 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with SCAP2. The function of SCAP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM134. Solute Carrier Family 17 (anion/sugar transporter), Member 5 (SLC17A5, Accession NM\_012434) is another VGAM766 host target gene. SLC17A5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC17A5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC17A5 BINDING SITE, designated SEQ ID:14814, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30031] Another function of VGAM766 is therefore inhibition of Solute Carrier Family 17 (anion/sugar transporter), Member 5 (SLC17A5, Accession NM\_012434), a gene which is a member of a family of anion/cation symporters. Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC17A5. The function of SLC17A5 has been es-

established by previous studies. Aula et al. (2000) identified a large number of mutations in SLC17A5 in patients presenting with either Salla disease or the infantile sialic acid storage disorder. All 80 Finnish patients with Salla disease had the R39C mutation (604322.0001); 91% of them were homozygous for this old founder mutation. The compound heterozygous patients, with the founder mutation in only 1 allele, presented with a more severe phenotype than did the homozygous patients. The same R39C mutation was also found in most of the Swedish patients with SD and in heterozygous form in 5 patients from central Europe who presented with an unusually severe (intermediate) SD phenotype. Ten different mutations, including deletions, insertions, and missense and nonsense mutations, were identified in patients with the most severe ISSD phenotype. Using a positional cloning approach in a search for the gene that is mutant in sialic acid storage diseases (see OMIM Ref. No. 269920), Verheijen et al. (1999) identified an EST from the region of mapping on 6q14–q15 that they labeled SLC17A5 and subsequently showed to be mutant in these disorders. The sequence they isolated included an open reading frame (ORF) of 1,485 bp, predicting a protein sequence of 495 amino

acids. A database search showed that the new sequence had homology to members of the anion/cation symporter (ACS) family of transporters. This family contains eukaryotic inorganic anion transporters (such as Na<sup>+</sup>/phosphate cotransporters) as well as prokaryotic organic anion transporters (including H<sup>+</sup>/acid sugar symporters for hexuronate and glucarate). Verheijen et al. (1999) suggested that the product of the SLC17A5 gene be designated 'sialin' because of its relation to sialic acid storage diseases. Sialin contains a characteristic motif in the fourth transmembrane-spanning domain that is present in all members of the ACS family. They could demonstrate homology of sialin with human Na<sup>+</sup>/phosphate symporters by sequence alignment. For example, sialin shows 34% sequence identity with NPT1 (SLC17A1; 182308). Only the N- and C-terminal regions do not show homology. Verheijen et al. (1999) found extensive homology of human sialin with proteins in other species. On Northern blot analysis of human tissues, Verheijen et al. (1999) found ubiquitous expression of an approximately 4.5-kb major transcript of SLC17A5, and an additional transcript of approximately 3.5 kb. They also observed a ubiquitously expressed 1.8-kb band after very long exposures. They sus-

pected that these different transcripts are due to multiple poly(A) addition sites. The SLC17A5 gene is also known as AST. Biancheri et al. (2002) described 2 Italian brothers with sialic acid storage disease that resembled Salla disease as observed in the Finnish population (OMIM Ref. No. 604369) rather than ISSD. Both brothers showed moderate intellectual disability, spastic ataxic syndrome, hypomyelination and cerebellar ataxia on MRI, and lysosomal storage, all typical of Salla disease. In one of the alleles of the younger brother, Biancheri et al. (2002) found the same 15-bp deletion in exon 6 that had been found by Verheijen et al. (1999). No R39C mutation (604322.0001) was found. The older brother had died at the age of 20 years and DNA testing was not performed. The second mutation in the younger brother was presumed to lie in a noncoding area of the gene.

[30032] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[30033] Aula, N.; Salomaki, P.; Timonen, R.; Verheijen, F.; Mancini, G.; Mansson, J.-E.; Aula, P.; Peltonen, L. : The spectrum of SLC17A5-gene mutations resulting in free sialic acid-storage diseases indicates some genotype-phenotype

correlation. Am. J. Hum. Genet. 67: 832–840, 2000. ; and

[30034] Verheijen, F. W.; Verbeek, E.; Aula, N.; Beerens, C. E. M. T.; Havelaar, A. C.; Joosse, M.; Peltonen, L.; Aula, P.; Galjaard, H.; van der Spek, P. J.; Mancini, G. M. S. : A new gene.

[30035] Further studies establishing the function and utilities of SLC17A5 are found in John Hopkins OMIM database record ID 604322, and in cited publications numbered 5011, 10827, 10828–1082 and 1656–1661 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Sulfotransferase Family, Cytosolic, 2A, Dehydroepiandrosterone (DHEA) –preferring, Member 1 (SULT2A1, Accession XM\_049895) is another VGAM766 host target gene. SULT2A1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SULT2A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SULT2A1 BINDING SITE, designated SEQ ID:35540, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30036] Another function of VGAM766 is therefore inhibition of Sulfotransferase Family, Cytosolic, 2A, Dehydroepiandros–

terone (DHEA) –preferring, Member 1 (SULT2A1, Accession XM\_049895), a gene which catalyzes the sulfation of steroids and bile acids in the liver and adrenal glands. Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SULT2A1. The function of SULT2A1 has been established by previous studies. One of the major roles of the sulfotransferases (ST) in the metabolism of drugs and endogenous compounds is the conversion of these substances into more hydrophilic water-soluble sulfate conjugates that can be easily excreted. Sulfation may also play a regulatory role for many endogenous compounds, such as steroids and neurotransmitters, by altering the biologic properties of these compounds. Otterness et al. (1992), Kong et al. (1992), and Comer et al. (1993) reported the cloning of cDNAs encoding liver dehydroepiandrosterone (DHEA) sulfotransferase. The predicted protein has 285 amino acids. Although Northern blot analysis of human liver RNA detected transcripts of 3 different sizes, Southern blot analysis of human DNA suggested that only 1 gene is present in the genome. This gene has an important role in the sulfation of both bile acids and steroids in the liver and adrenals. The human

adrenal form of this enzyme is physically, immunologically, and kinetically similar, perhaps identical, to the liver form. Dehydroepiandrosterone sulfate is quantitatively one of the major steroids secreted from the adrenal cortex. Since 20 to 25% of subjects have a high level of hepatic DHEA sulfotransferase activity, the possibility that this enzyme activity may be controlled by a genetic polymorphism was raised. Otterness et al. (1995) cloned the STD gene and demonstrated that it spans at least 17 kb and is composed of 6 exons and 5 introns.

[30037] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[30038] Comer, K. A.; Falany, J. L.; Falany, C. N. : Cloning and expression of human liver dehydroepiandrosterone sulphotransferase. *Biochem. J.* 289: 233–240, 1993. ; and

[30039] Otterness, D. M.; Her, C.; Aksoy, S.; Kimura, S.; Wieben, E. D.; Weinshilboum, R. M. : Human dehydroepiandrosterone sulfotransferase gene: molecular cloning and structural characterizat.

[30040] Further studies establishing the function and utilities of SULT2A1 are found in John Hopkins OMIM database record ID 125263, and in sited publications numbered

1999–2004 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. SUV39H2 (Accession NM\_024670) is another VGAM766 host target gene. SUV39H2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SUV39H2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SUV39H2 BINDING SITE, designated SEQ ID:23975, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30041] Another function of VGAM766 is therefore inhibition of SUV39H2 (Accession NM\_024670), a gene which is involved in gene repression and the modification of position-effect-variegation. Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SUV39H2. The function of SUV39H2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM424. Transient Receptor Potential Cation Channel, Subfamily M, Member 8 (TRPM8, Accession NM\_024080) is

another VGAM766 host target gene. TRPM8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRPM8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPM8 BINDING SITE, designated SEQ ID:23517, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30042] Another function of VGAM766 is therefore inhibition of Transient Receptor Potential Cation Channel, Subfamily M, Member 8 (TRPM8, Accession NM\_024080), a gene which is thought to form a receptor-activated calcium permeant cation channel. Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPM8. The function of TRPM8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM201.XT3 (Accession NM\_020208) is another VGAM766 host target gene. XT3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by XT3, corresponding to a HOST TARGET binding site such

as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of XT3 BINDING SITE, designated SEQ ID:21445, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30043] Another function of VGAM766 is therefore inhibition of XT3 (Accession NM\_020208), a gene which is a Kidney-specific orphan transporter. Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XT3. The function of XT3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM21.Ac-like Transposable Element (ALTE, Accession NM\_004729) is another VGAM766 host target gene. ALTE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ALTE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALTE BINDING SITE, designated SEQ ID:11104, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30044] Another function of VGAM766 is therefore inhibition of Ac-like Transposable Element (ALTE, Accession NM\_004729). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALTE. ARNTL2 (Accession NM\_020183) is another VGAM766 host target gene. ARNTL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARNTL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARNTL2 BINDING SITE, designated SEQ ID:21414, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30045] Another function of VGAM766 is therefore inhibition of ARNTL2 (Accession NM\_020183). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARNTL2. Baculoviral IAP Repeat-containing 1 (BIRC1, Accession NM\_004536) is another VGAM766 host target gene. BIRC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BIRC1, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BIRC1 BINDING SITE, designated SEQ ID:10886, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30046] Another function of VGAM766 is therefore inhibition of Baculoviral IAP Repeat-containing 1 (BIRC1, Accession NM\_004536). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BIRC1. BLOV1 (Accession XM\_083866) is another VGAM766 host target gene. BLOV1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BLOV1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BLOV1 BINDING SITE, designated SEQ ID:37521, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30047] Another function of VGAM766 is therefore inhibition of BLOV1 (Accession XM\_083866). Accordingly, utilities of

VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BLOV1. Chromosome 20 Open Reading Frame 108 (C20orf108, Accession NM\_080821) is another VGAM766 host target gene. C20orf108 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf108, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf108 BINDING SITE, designated SEQ ID:28085, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30048] Another function of VGAM766 is therefore inhibition of Chromosome 20 Open Reading Frame 108 (C20orf108, Accession NM\_080821). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf108. Chromosome 9 Open Reading Frame 5 (C9orf5, Accession NM\_032012) is another VGAM766 host target gene. C9orf5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C9orf5, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C9orf5 BINDING SITE, designated SEQ ID:25714, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30049] Another function of VGAM766 is therefore inhibition of Chromosome 9 Open Reading Frame 5 (C9orf5, Accession NM\_032012). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C9orf5. Ceramide Kinase (cerk, Accession NM\_022766) is another VGAM766 host target gene. cerk BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by cerk, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of cerk BINDING SITE, designated SEQ ID:23013, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30050] Another function of VGAM766 is therefore inhibition of Ceramide Kinase (cerk, Accession NM\_022766). Accord-

ingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with cerk. CG012 (Accession XM\_096710) is another VGAM766 host target gene. CG012 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CG012, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CG012 BINDING SITE, designated SEQ ID:40488, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30051] Another function of VGAM766 is therefore inhibition of CG012 (Accession XM\_096710). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CG012. COE2 (Accession XM\_034639) is another VGAM766 host target gene. COE2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by COE2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COE2 BINDING SITE, designated SEQ

ID:32127, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30052] Another function of VGAM766 is therefore inhibition of COE2 (Accession XM\_034639). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COE2. DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 34 (DDX34, Accession NM\_014681) is another VGAM766 host target gene. DDX34 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DDX34, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDX34 BINDING SITE, designated SEQ ID:16162, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30053] Another function of VGAM766 is therefore inhibition of DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 34 (DDX34, Accession NM\_014681). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDX34.

DIS3 (Accession NM\_014953) is another VGAM766 host target gene. DIS3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DIS3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DIS3 BINDING SITE, designated SEQ ID:17301, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30054] Another function of VGAM766 is therefore inhibition of DIS3 (Accession NM\_014953). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DIS3. DKFZP434I1735 (Accession XM\_113763) is another VGAM766 host target gene. DKFZP434I1735 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434I1735, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434I1735 BINDING SITE, designated SEQ ID:42421, to the nucleotide sequence of VGAM766 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3477.

[30055] Another function of VGAM766 is therefore inhibition of DKFZP434I1735 (Accession XM\_113763). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434I1735. DKFZP564B1023 (Accession NM\_031306) is another VGAM766 host target gene. DKFZP564B1023 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564B1023, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564B1023 BINDING SITE, designated SEQ ID:25343, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30056] Another function of VGAM766 is therefore inhibition of DKFZP564B1023 (Accession NM\_031306). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564B1023. DKFZP586D2223 (Accession NM\_018561) is another VGAM766 host target gene. DKFZP586D2223 BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by DKFZP586D2223, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP586D2223 BINDING SITE, designated SEQ ID:20645, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30057] Another function of VGAM766 is therefore inhibition of DKFZP586D2223 (Accession NM\_018561). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586D2223. DKFZp586I021 (Accession NM\_032271) is another VGAM766 host target gene. DKFZp586I021 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp586I021, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp586I021 BINDING SITE, designated SEQ ID:26018, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30058] Another function of VGAM766 is therefore inhibition of DKFZp586I021 (Accession NM\_032271). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp586I021. DKFZp761J139 (Accession NM\_032280) is another VGAM766 host target gene. DKFZp761J139 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZp761J139, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761J139 BINDING SITE, designated SEQ ID:26036, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30059] Another function of VGAM766 is therefore inhibition of DKFZp761J139 (Accession NM\_032280). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761J139. ERAP140 (Accession XM\_059748) is another VGAM766 host target gene. ERAP140 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ERAP140, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ERAP140 BINDING SITE, designated SEQ ID:37086, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30060] Another function of VGAM766 is therefore inhibition of ERAP140 (Accession XM\_059748). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ERAP140. F-box Only Protein 27 (FBXO27, Accession XM\_059045) is another VGAM766 host target gene. FBXO27 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FBXO27, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBXO27 BINDING SITE, designated SEQ ID:36836, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30061] Another function of VGAM766 is therefore inhibition of F-box Only Protein 27 (FBXO27, Accession XM\_059045). Accordingly, utilities of VGAM766 include diagnosis, preven-

tion and treatment of diseases and clinical conditions associated with FBXO27. FK506 Binding Protein 14, 22 KDa (FKBP14, Accession NM\_017946) is another VGAM766 host target gene. FKBP14 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FKBP14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FKBP14 BINDING SITE, designated SEQ ID:19645, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30062] Another function of VGAM766 is therefore inhibition of FK506 Binding Protein 14, 22 KDa (FKBP14, Accession NM\_017946). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FKBP14. FLJ10008 (Accession NM\_017970) is another VGAM766 host target gene. FLJ10008 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10008, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of FLJ10008 BINDING SITE, designated SEQ ID:19692, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30063] Another function of VGAM766 is therefore inhibition of FLJ10008 (Accession NM\_017970). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10008. FLJ10650 (Accession NM\_018168) is another VGAM766 host target gene. FLJ10650 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10650, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10650 BINDING SITE, designated SEQ ID:19986, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30064] Another function of VGAM766 is therefore inhibition of FLJ10650 (Accession NM\_018168). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10650. FLJ10803 (Accession NM\_018224) is another VGAM766

host target gene. FLJ10803 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10803, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10803 BINDING SITE, designated SEQ ID:20155, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30065] Another function of VGAM766 is therefore inhibition of FLJ10803 (Accession NM\_018224). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10803. FLJ11151 (Accession XM\_042224) is another VGAM766 host target gene. FLJ11151 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11151, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11151 BINDING SITE, designated SEQ ID:33706, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30066] Another function of VGAM766 is therefore inhibition of FLJ11151 (Accession XM\_042224). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11151. FLJ11700 (Accession NM\_024892) is another VGAM766 host target gene. FLJ11700 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11700, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11700 BINDING SITE, designated SEQ ID:24367, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30067] Another function of VGAM766 is therefore inhibition of FLJ11700 (Accession NM\_024892). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11700. FLJ12800 (Accession NM\_022903) is another VGAM766 host target gene. FLJ12800 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12800, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

**BINDING SITE III.** Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12800 BINDING SITE, designated SEQ ID:23191, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30068] Another function of VGAM766 is therefore inhibition of FLJ12800 (Accession NM\_022903). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12800. FLJ14641 (Accession NM\_032817) is another VGAM766 host target gene. FLJ14641 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14641, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14641 BINDING SITE, designated SEQ ID:26587, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30069] Another function of VGAM766 is therefore inhibition of FLJ14641 (Accession NM\_032817). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14641.

FLJ20013 (Accession NM\_017621) is another VGAM766 host target gene. FLJ20013 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20013, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20013 BINDING SITE, designated SEQ ID:19121, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30070] Another function of VGAM766 is therefore inhibition of FLJ20013 (Accession NM\_017621). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20013. FLJ20211 (Accession NM\_017713) is another VGAM766 host target gene. FLJ20211 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20211, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20211 BINDING SITE, designated SEQ ID:19296, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:3477.

[30071] Another function of VGAM766 is therefore inhibition of FLJ20211 (Accession NM\_017713). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20211. FLJ20783 (Accession NM\_017958) is another VGAM766 host target gene. FLJ20783 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20783, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20783 BINDING SITE, designated SEQ ID:19670, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30072] Another function of VGAM766 is therefore inhibition of FLJ20783 (Accession NM\_017958). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20783. FLJ20825 (Accession NM\_017962) is another VGAM766 host target gene. FLJ20825 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20825, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20825 BINDING SITE, designated SEQ ID:19681, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30073] Another function of VGAM766 is therefore inhibition of FLJ20825 (Accession NM\_017962). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20825. FLJ21687 (Accession NM\_024859) is another VGAM766 host target gene. FLJ21687 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21687, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21687 BINDING SITE, designated SEQ ID:24289, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30074] Another function of VGAM766 is therefore inhibition of FLJ21687 (Accession NM\_024859). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FLJ21687. FLJ21870 (Accession NM\_023016) is another VGAM766 host target gene. FLJ21870 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21870, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21870 BINDING SITE, designated SEQ ID:23280, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30075] Another function of VGAM766 is therefore inhibition of FLJ21870 (Accession NM\_023016). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21870. FLJ22692 (Accession NM\_025049) is another VGAM766 host target gene. FLJ22692 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22692, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22692 BINDING SITE, designated SEQ ID:24645, to the nucleotide sequence of

VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30076] Another function of VGAM766 is therefore inhibition of FLJ22692 (Accession NM\_025049). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22692. FLJ22814 (Accession NM\_024916) is another VGAM766 host target gene. FLJ22814 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22814, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22814 BINDING SITE, designated SEQ ID:24441, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30077] Another function of VGAM766 is therefore inhibition of FLJ22814 (Accession NM\_024916). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22814. FLJ23235 (Accession NM\_024943) is another VGAM766 host target gene. FLJ23235 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by FLJ23235, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23235 BINDING SITE, designated SEQ ID:24488, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30078] Another function of VGAM766 is therefore inhibition of FLJ23235 (Accession NM\_024943). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23235. FLJ31737 (Accession NM\_144984) is another VGAM766 host target gene. FLJ31737 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ31737, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ31737 BINDING SITE, designated SEQ ID:29590, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30079] Another function of VGAM766 is therefore inhibition of FLJ31737 (Accession NM\_144984). Accordingly, utilities of

VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31737. KIAA0252 (Accession XM\_031646) is another VGAM766 host target gene. KIAA0252 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0252, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0252 BINDING SITE, designated SEQ ID:31448, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30080] Another function of VGAM766 is therefore inhibition of KIAA0252 (Accession XM\_031646). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0252. KIAA0266 (Accession NM\_021645) is another VGAM766 host target gene. KIAA0266 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0266, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA0266 BINDING SITE, designated SEQ ID:22310, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30081] Another function of VGAM766 is therefore inhibition of KIAA0266 (Accession NM\_021645). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0266. KIAA0420 (Accession XM\_032693) is another VGAM766 host target gene. KIAA0420 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0420, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0420 BINDING SITE, designated SEQ ID:31723, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30082] Another function of VGAM766 is therefore inhibition of KIAA0420 (Accession XM\_032693). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0420. KIAA0472 (Accession XM\_050147) is another VGAM766 host target gene. KIAA0472 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0472, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0472 BINDING SITE, designated SEQ ID:35578, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30083] Another function of VGAM766 is therefore inhibition of KIAA0472 (Accession XM\_050147). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0472. KIAA0527 (Accession XM\_171054) is another VGAM766 host target gene. KIAA0527 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0527, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0527 BINDING SITE, designated SEQ ID:45841, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30084] Another function of VGAM766 is therefore inhibition of

KIAA0527 (Accession XM\_171054). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0527. KIAA0794 (Accession XM\_087353) is another VGAM766 host target gene. KIAA0794 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0794, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0794 BINDING SITE, designated SEQ ID:39181, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30085] Another function of VGAM766 is therefore inhibition of KIAA0794 (Accession XM\_087353). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0794. KIAA1228 (Accession XM\_036408) is another VGAM766 host target gene. KIAA1228 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1228, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1228 BINDING SITE, designated SEQ ID:32444, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30086] Another function of VGAM766 is therefore inhibition of KIAA1228 (Accession XM\_036408). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1228. KIAA1641 (Accession XM\_087167) is another VGAM766 host target gene. KIAA1641 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1641, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1641 BINDING SITE, designated SEQ ID:39100, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30087] Another function of VGAM766 is therefore inhibition of KIAA1641 (Accession XM\_087167). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1641. KIAA1871 (Accession XM\_028409) is another

VGAM766 host target gene. KIAA1871 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1871, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1871 BINDING SITE, designated SEQ ID:30705, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30088] Another function of VGAM766 is therefore inhibition of KIAA1871 (Accession XM\_028409). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1871. KIAA1872 (Accession XM\_031917) is another VGAM766 host target gene. KIAA1872 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1872, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1872 BINDING SITE, designated SEQ ID:31519, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30089] Another function of VGAM766 is therefore inhibition of KIAA1872 (Accession XM\_031917). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1872. KIAA1969 (Accession XM\_086098) is another VGAM766 host target gene. KIAA1969 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1969, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1969 BINDING SITE, designated SEQ ID:38491, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30090] Another function of VGAM766 is therefore inhibition of KIAA1969 (Accession XM\_086098). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1969. KR18 (Accession NM\_033288) is another VGAM766 host target gene. KR18 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KR18, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KR18 BINDING SITE, designated SEQ ID:27118, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30091] Another function of VGAM766 is therefore inhibition of KR18 (Accession NM\_033288). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KR18. LIM (Accession NM\_006457) is another VGAM766 host target gene. LIM BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LIM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LIM BINDING SITE, designated SEQ ID:13178, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30092] Another function of VGAM766 is therefore inhibition of LIM (Accession NM\_006457). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIM. LRG (Accession NM\_052972) is another VGAM766 host target

gene. LRG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LRG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LRG BINDING SITE, designated SEQ ID:27546, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30093] Another function of VGAM766 is therefore inhibition of LRG (Accession NM\_052972). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LRG. Mesoderm Development Candidate 2 (MESDC2, Accession XM\_051854) is another VGAM766 host target gene. MESDC2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MESDC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MESDC2 BINDING SITE, designated SEQ ID:35893, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30094] Another function of VGAM766 is therefore inhibition of Mesoderm Development Candidate 2 (MESDC2, Accession XM\_051854). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MESDC2. MGC14407 (Accession NM\_032908) is another VGAM766 host target gene. MGC14407 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC14407, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC14407 BINDING SITE, designated SEQ ID:26728, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30095] Another function of VGAM766 is therefore inhibition of MGC14407 (Accession NM\_032908). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC14407. MGC2562 (Accession NM\_032374) is another VGAM766 host target gene. MGC2562 BINDING SITE1 and MGC2562 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by

MGC2562, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2562 BINDING SITE1 and MGC2562 BINDING SITE2, designated SEQ ID:26162 and SEQ ID:26164 respectively, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30096] Another function of VGAM766 is therefore inhibition of MGC2562 (Accession NM\_032374). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2562. MGC4840 (Accession XM\_049476) is another VGAM766 host target gene. MGC4840 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC4840, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4840 BINDING SITE, designated SEQ ID:35439, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30097] Another function of VGAM766 is therefore inhibition of

MGC4840 (Accession XM\_049476). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4840. PRO0478 (Accession NM\_014129) is another VGAM766 host target gene. PRO0478 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRO0478, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0478 BINDING SITE, designated SEQ ID:15397, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30098] Another function of VGAM766 is therefore inhibition of PRO0478 (Accession NM\_014129). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0478. Rpo1-2 (Accession NM\_019014) is another VGAM766 host target gene. Rpo1-2 BINDING SITE1 and Rpo1-2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by Rpo1-2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of Rpo1-2 BINDING SITE1 and Rpo1-2 BINDING SITE2, designated SEQ ID:21102 and SEQ ID:21103 respectively, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30099] Another function of VGAM766 is therefore inhibition of Rpo1-2 (Accession NM\_019014). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Rpo1-2. Sodium Channel, Voltage-gated, Type XII, Alpha Polypeptide (SCN12A, Accession NM\_014139) is another VGAM766 host target gene. SCN12A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCN12A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCN12A BINDING SITE, designated SEQ ID:15409, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30100] Another function of VGAM766 is therefore inhibition of Sodium Channel, Voltage-gated, Type XII, Alpha Polypeptide (SCN12A, Accession NM\_014139). Accordingly, utili-

ties of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCN12A. Serine Palmitoyltransferase, Long Chain Base Subunit 2 (SPTLC2, Accession NM\_004863) is another VGAM766 host target gene. SPTLC2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SPTLC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPTLC2 BINDING SITE, designated SEQ ID:11281, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30101] Another function of VGAM766 is therefore inhibition of Serine Palmitoyltransferase, Long Chain Base Subunit 2 (SPTLC2, Accession NM\_004863). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPTLC2. TRIAD3 (Accession XM\_170517) is another VGAM766 host target gene. TRIAD3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRIAD3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BIND-

ING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIAD3 BINDING SITE, designated SEQ ID:45347, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30102] Another function of VGAM766 is therefore inhibition of TRIAD3 (Accession XM\_170517). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIAD3. Williams–Beuren Syndrome Chromosome Region 23 (WBSCR23, Accession NM\_025042) is another VGAM766 host target gene. WBSCR23 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by WBSCR23, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WBSCR23 BINDING SITE, designated SEQ ID:24640, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30103] Another function of VGAM766 is therefore inhibition of Williams–Beuren Syndrome Chromosome Region 23 (WBSCR23, Accession NM\_025042). Accordingly, utilities

of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WB-SCR23. WSB1 (Accession NM\_134264) is another VGAM766 host target gene. WSB1 BINDING SITE1 and WSB1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by WSB1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WSB1 BINDING SITE1 and WSB1 BINDING SITE2, designated SEQ ID:28615 and SEQ ID:28621 respectively, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30104] Another function of VGAM766 is therefore inhibition of WSB1 (Accession NM\_134264). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WSB1. LOC115129 (Accession XM\_055292) is another VGAM766 host target gene. LOC115129 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC115129, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of LOC115129 BINDING SITE, designated SEQ ID:36251, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30105] Another function of VGAM766 is therefore inhibition of LOC115129 (Accession XM\_055292). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115129. LOC127428 (Accession XM\_059144) is another VGAM766 host target gene. LOC127428 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC127428, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC127428 BINDING SITE, designated SEQ ID:36896, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30106] Another function of VGAM766 is therefore inhibition of LOC127428 (Accession XM\_059144). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC127428. LOC134147 (Accession NM\_138809) is an-

other VGAM766 host target gene. LOC134147 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC134147, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC134147 BINDING SITE, designated SEQ ID:29031, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30107] Another function of VGAM766 is therefore inhibition of LOC134147 (Accession NM\_138809). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC134147. LOC145988 (Accession XM\_085290) is another VGAM766 host target gene. LOC145988 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145988, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145988 BINDING SITE, designated SEQ ID:38038, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30108] Another function of VGAM766 is therefore inhibition of LOC145988 (Accession XM\_085290). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145988. LOC146229 (Accession XM\_085387) is another VGAM766 host target gene. LOC146229 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146229, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146229 BINDING SITE, designated SEQ ID:38110, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30109] Another function of VGAM766 is therefore inhibition of LOC146229 (Accession XM\_085387). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146229. LOC147837 (Accession XM\_085915) is another VGAM766 host target gene. LOC147837 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147837, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147837 BINDING SITE, designated SEQ ID:38393, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30110] Another function of VGAM766 is therefore inhibition of LOC147837 (Accession XM\_085915). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147837. LOC148147 (Accession XM\_086071) is another VGAM766 host target gene. LOC148147 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148147, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148147 BINDING SITE, designated SEQ ID:38476, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30111] Another function of VGAM766 is therefore inhibition of LOC148147 (Accession XM\_086071). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC148147. LOC148254 (Accession XM\_086121) is another VGAM766 host target gene. LOC148254 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148254, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148254 BINDING SITE, designated SEQ ID:38502, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30112] Another function of VGAM766 is therefore inhibition of LOC148254 (Accession XM\_086121). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148254. LOC149705 (Accession XM\_097711) is another VGAM766 host target gene. LOC149705 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149705, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149705 BINDING SITE, designated SEQ ID:41052, to the nucleotide sequence of VGAM766 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3477.

[30113] Another function of VGAM766 is therefore inhibition of LOC149705 (Accession XM\_097711). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149705. LOC150245 (Accession XM\_097843) is another VGAM766 host target gene. LOC150245 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150245, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150245 BINDING SITE, designated SEQ ID:41162, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30114] Another function of VGAM766 is therefore inhibition of LOC150245 (Accession XM\_097843). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150245. LOC150481 (Accession XM\_086929) is another VGAM766 host target gene. LOC150481 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150481, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150481 BINDING SITE, designated SEQ ID:38980, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30115] Another function of VGAM766 is therefore inhibition of LOC150481 (Accession XM\_086929). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150481. LOC151248 (Accession XM\_087143) is another VGAM766 host target gene. LOC151248 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151248, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151248 BINDING SITE, designated SEQ ID:39088, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30116] Another function of VGAM766 is therefore inhibition of LOC151248 (Accession XM\_087143). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC151248. LOC152426 (Accession XM\_098225) is another VGAM766 host target gene. LOC152426 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152426, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152426 BINDING SITE, designated SEQ ID:41499, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30117] Another function of VGAM766 is therefore inhibition of LOC152426 (Accession XM\_098225). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152426. LOC153727 (Accession XM\_098422) is another VGAM766 host target gene. LOC153727 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153727, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153727 BINDING SITE, designated SEQ ID:41681, to

the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30118] Another function of VGAM766 is therefore inhibition of LOC153727 (Accession XM\_098422). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153727. LOC155006 (Accession XM\_088117) is another VGAM766 host target gene. LOC155006 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC155006, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155006 BINDING SITE, designated SEQ ID:39526, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30119] Another function of VGAM766 is therefore inhibition of LOC155006 (Accession XM\_088117). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155006. LOC158088 (Accession XM\_098872) is another VGAM766 host target gene. LOC158088 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC158088, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158088 BINDING SITE, designated SEQ ID:41917, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30120] Another function of VGAM766 is therefore inhibition of LOC158088 (Accession XM\_098872). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158088. LOC158677 (Accession XM\_098976) is another VGAM766 host target gene. LOC158677 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158677, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158677 BINDING SITE, designated SEQ ID:42023, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30121] Another function of VGAM766 is therefore inhibition of LOC158677 (Accession XM\_098976). Accordingly, utilities

of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158677. LOC158819 (Accession XM\_098995) is another VGAM766 host target gene. LOC158819 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158819, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158819 BINDING SITE, designated SEQ ID:42026, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30122] Another function of VGAM766 is therefore inhibition of LOC158819 (Accession XM\_098995). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158819. LOC159036 (Accession XM\_099018) is another VGAM766 host target gene. LOC159036 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC159036, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC159036 BINDING SITE, designated SEQ ID:42054, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30123] Another function of VGAM766 is therefore inhibition of LOC159036 (Accession XM\_099018). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC159036. LOC200251 (Accession XM\_114173) is another VGAM766 host target gene. LOC200251 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200251, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200251 BINDING SITE, designated SEQ ID:42756, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30124] Another function of VGAM766 is therefore inhibition of LOC200251 (Accession XM\_114173). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200251. LOC201220 (Accession XM\_113321) is another VGAM766 host target gene. LOC201220 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC201220, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201220 BINDING SITE, designated SEQ ID:42224, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30125] Another function of VGAM766 is therefore inhibition of LOC201220 (Accession XM\_113321). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201220. LOC201895 (Accession XM\_114396) is another VGAM766 host target gene. LOC201895 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC201895, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201895 BINDING SITE, designated SEQ ID:42926, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30126] Another function of VGAM766 is therefore inhibition of

LOC201895 (Accession XM\_114396). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201895. LOC203378 (Accession XM\_117541) is another VGAM766 host target gene. LOC203378 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203378, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203378 BINDING SITE, designated SEQ ID:43553, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30127] Another function of VGAM766 is therefore inhibition of LOC203378 (Accession XM\_117541). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203378. LOC220662 (Accession XM\_165978) is another VGAM766 host target gene. LOC220662 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220662, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC220662 BINDING SITE, designated SEQ ID:43823, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30128] Another function of VGAM766 is therefore inhibition of LOC220662 (Accession XM\_165978). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220662. LOC221477 (Accession XM\_166397) is another VGAM766 host target gene. LOC221477 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221477, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221477 BINDING SITE, designated SEQ ID:44254, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30129] Another function of VGAM766 is therefore inhibition of LOC221477 (Accession XM\_166397). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221477. LOC221543 (Accession XM\_168091) is an-

other VGAM766 host target gene. LOC221543 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC221543, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221543 BINDING SITE, designated SEQ ID:45013, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30130] Another function of VGAM766 is therefore inhibition of LOC221543 (Accession XM\_168091). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221543. LOC221755 (Accession XM\_166465) is another VGAM766 host target gene. LOC221755 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221755, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221755 BINDING SITE, designated SEQ ID:44386, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30131] Another function of VGAM766 is therefore inhibition of LOC221755 (Accession XM\_166465). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221755. LOC254122 (Accession XM\_170660) is another VGAM766 host target gene. LOC254122 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254122, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254122 BINDING SITE, designated SEQ ID:45436, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30132] Another function of VGAM766 is therefore inhibition of LOC254122 (Accession XM\_170660). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254122. LOC255196 (Accession XM\_173157) is another VGAM766 host target gene. LOC255196 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255196, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255196 BINDING SITE, designated SEQ ID:46413, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30133] Another function of VGAM766 is therefore inhibition of LOC255196 (Accession XM\_173157). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255196. LOC257354 (Accession XM\_170810) is another VGAM766 host target gene. LOC257354 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257354, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257354 BINDING SITE, designated SEQ ID:45576, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30134] Another function of VGAM766 is therefore inhibition of LOC257354 (Accession XM\_170810). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC257354. LOC51336 (Accession NM\_016646) is another VGAM766 host target gene. LOC51336 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51336, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51336 BINDING SITE, designated SEQ ID:18757, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30135] Another function of VGAM766 is therefore inhibition of LOC51336 (Accession NM\_016646). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51336. LOC90979 (Accession XM\_035323) is another VGAM766 host target gene. LOC90979 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90979, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90979 BINDING SITE, designated SEQ ID:32232, to the nucleotide sequence of VGAM766 RNA, herein designated

VGAM RNA, also designated SEQ ID:3477.

[30136] Another function of VGAM766 is therefore inhibition of LOC90979 (Accession XM\_035323). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90979. LOC92078 (Accession XM\_042684) is another VGAM766 host target gene. LOC92078 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92078, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92078 BINDING SITE, designated SEQ ID:33743, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30137] Another function of VGAM766 is therefore inhibition of LOC92078 (Accession XM\_042684). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92078. LOC92421 (Accession XM\_044996) is another VGAM766 host target gene. LOC92421 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92421, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92421 BINDING SITE, designated SEQ ID:34310, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30138] Another function of VGAM766 is therefore inhibition of LOC92421 (Accession XM\_044996). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92421. LOC92771 (Accession NM\_033424) is another VGAM766 host target gene. LOC92771 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92771, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92771 BINDING SITE, designated SEQ ID:27249, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30139] Another function of VGAM766 is therefore inhibition of LOC92771 (Accession NM\_033424). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC92771. LOC93132 (Accession XM\_049396) is another VGAM766 host target gene. LOC93132 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC93132, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93132 BINDING SITE, designated SEQ ID:35409, to the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, also designated SEQ ID:3477.

[30140] Another function of VGAM766 is therefore inhibition of LOC93132 (Accession XM\_049396). Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93132. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 767 (VGAM767) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30141] VGAM767 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM767 was detected is described hereinabove with reference to Figs. 1–8.

[30142] VGAM767 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Coronavirus. VGAM767 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30143] VGAM767 gene encodes a VGAM767 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM767 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM767 precursor RNA is designated SEQ ID:753, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:753 is located at position 6557 relative to the genome of Bovine Coronavirus.

[30144] VGAM767 precursor RNA folds onto itself, forming VGAM767 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA

genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30145] An enzyme complex designated DICER COMPLEX, `dices` the VGAM767 folded precursor RNA into VGAM767 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 68%) nucleotide sequence of VGAM767 RNA is designated SEQ ID:3478, and is provided hereinbelow with reference to the sequence listing part.

[30146] VGAM767 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM767 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM767 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[30147] VGAM767 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM767 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM767 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM767 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM767 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[30148] The complementary binding of VGAM767 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM767 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM767 host target RNA into VGAM767 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30149] It is appreciated that VGAM767 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM767 host target genes. The mRNA of each one of this plurality of VGAM767 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM767 RNA, herein designated VGAM RNA, and which when bound by VGAM767 RNA causes inhibition of translation of respective one or more VGAM767 host target proteins.

[30150] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM767 gene, herein designated VGAM GENE, on one or more VGAM767 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[30151] It is yet further appreciated that a function of VGAM767 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM767 include diagnosis, prevention and treatment of viral infection by Bovine Coronavirus. Specific functions, and accordingly utilities, of VGAM767 correlate with, and may be deduced from, the identity of the host target genes which VGAM767 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30152] Nucleotide sequences of the VGAM767 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM767 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM767 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM767 are further described hereinbelow with reference to Table 1.

[30153] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM767 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM767 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30154] As mentioned hereinabove with reference to Fig. 1, a function of VGAM767 gene, herein designated VGAM is inhibition of expression of VGAM767 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM767 correlate with, and may be deduced from, the identity of the target genes which VGAM767 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30155] LOC93587 (Accession XM\_052377) is a VGAM767 host target gene. LOC93587 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA

encoded by LOC93587, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93587 BINDING SITE, designated SEQ ID:35963, to the nucleotide sequence of VGAM767 RNA, herein designated VGAM RNA, also designated SEQ ID:3478.

[30156] A function of VGAM767 is therefore inhibition of LOC93587 (Accession XM\_052377). Accordingly, utilities of VGAM767 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93587. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 768 (VGAM768) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30157] VGAM768 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM768 was detected is described hereinabove with reference to Figs. 1–8.

[30158] VGAM768 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Bovine Coronavirus. VGAM768 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30159] VGAM768 gene encodes a VGAM768 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM768 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM768 precursor RNA is designated SEQ ID:754, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:754 is located at position 13125 relative to the genome of Bovine Coronavirus.

[30160] VGAM768 precursor RNA folds onto itself, forming VGAM768 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30161] An enzyme complex designated DICER COMPLEX, `dices` the VGAM768 folded precursor RNA into VGAM768 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM768 RNA is designated SEQ ID:3479, and is provided hereinbelow with reference to the sequence listing part.

[30162] VGAM768 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM768 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM768 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[30163] VGAM768 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM768 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM768 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM768 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM768 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[30164] The complementary binding of VGAM768 RNA, herein designated VGAM RNA, to host target binding sites on VGAM768 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM768 host tar-

get RNA into VGAM768 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30165] It is appreciated that VGAM768 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM768 host target genes. The mRNA of each one of this plurality of VGAM768 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM768 RNA, herein designated VGAM RNA, and which when bound by VGAM768 RNA causes inhibition of translation of respective one or more VGAM768 host target proteins.

[30166] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM768 gene, herein designated VGAM GENE, on one or more VGAM768 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[30167] It is yet further appreciated that a function of VGAM768 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM768 include diagnosis, prevention and treatment of viral infection by Bovine Coronavirus. Specific functions, and accordingly utilities, of VGAM768 correlate with, and may be deduced from, the identity of the host target genes which VGAM768 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30168] Nucleotide sequences of the VGAM768 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM768 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM768 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM768 are further

described hereinbelow with reference to Table 1.

[30169] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM768 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM768 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30170] As mentioned hereinabove with reference to Fig. 1, a function of VGAM768 gene, herein designated VGAM is inhibition of expression of VGAM768 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM768 correlate with, and may be deduced from, the identity of the target genes which VGAM768 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30171] Protein Tyrosine Phosphatase, Receptor Type, C (PTPRC, Accession NM\_080923) is a VGAM768 host target gene. PTPRC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTPRC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of PTPRC BINDING SITE, designated SEQ ID:28148, to the nucleotide sequence of VGAM768 RNA, herein designated VGAM RNA, also designated SEQ ID:3479.

[30172] A function of VGAM768 is therefore inhibition of Protein Tyrosine Phosphatase, Receptor Type, C (PTPRC, Accession NM\_080923). Accordingly, utilities of VGAM768 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPRC. GLP (Accession NM\_018652) is another VGAM768 host target gene. GLP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GLP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GLP BINDING SITE, designated SEQ ID:20722, to the nucleotide sequence of VGAM768 RNA, herein designated VGAM RNA, also designated SEQ ID:3479.

[30173] Another function of VGAM768 is therefore inhibition of GLP (Accession NM\_018652). Accordingly, utilities of VGAM768 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GLP. LOC220538 (Accession XM\_165407) is another VGAM768

host target gene. LOC220538 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220538, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220538 BINDING SITE, designated SEQ ID:43625, to the nucleotide sequence of VGAM768 RNA, herein designated VGAM RNA, also designated SEQ ID:3479.

[30174] Another function of VGAM768 is therefore inhibition of LOC220538 (Accession XM\_165407). Accordingly, utilities of VGAM768 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220538. LOC257286 (Accession XM\_170549) is another VGAM768 host target gene. LOC257286 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257286, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257286 BINDING SITE, designated SEQ ID:45372, to the nucleotide sequence of VGAM768 RNA, herein designated VGAM RNA, also designated SEQ ID:3479.

[30175] Another function of VGAM768 is therefore inhibition of LOC257286 (Accession XM\_170549). Accordingly, utilities of VGAM768 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257286. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 769 (VGAM769) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30176] VGAM769 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM769 was detected is described hereinabove with reference to Figs. 1–8.

[30177] VGAM769 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Coronavirus. VGAM769 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30178] VGAM769 gene encodes a VGAM769 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM769

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM769 precursor RNA is designated SEQ ID:755, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:755 is located at position 16313 relative to the genome of Bovine Coronavirus.

[30179] VGAM769 precursor RNA folds onto itself, forming VGAM769 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30180] An enzyme complex designated DICER COMPLEX, `dices` the VGAM769 folded precursor RNA into VGAM769 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 45%) nucleotide sequence of VGAM769 RNA is designated SEQ ID:3480, and is provided hereinbelow with reference to the sequence listing part.

[30181] VGAM769 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM769 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM769 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[30182] VGAM769 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM769 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM769 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM769 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM769 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[30183] The complementary binding of VGAM769 RNA, herein designated VGAM RNA, to host target binding sites on VGAM769 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM769 host target RNA into VGAM769 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30184] It is appreciated that VGAM769 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM769 host target genes. The mRNA of each one of this plurality of VGAM769 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM769 RNA, herein designated VGAM RNA, and which when bound by VGAM769 RNA causes inhibition of translation of respective one or more VGAM769 host target proteins.

[30185] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM769 gene, herein designated VGAM GENE, on one or more VGAM769 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[30186] It is yet further appreciated that a function of VGAM769 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM769 include diagnosis, prevention and treatment of viral infection by Bovine Coronavirus. Specific functions, and accordingly utilities, of VGAM769 correlate with, and may be deduced from, the identity of the host target genes which VGAM769 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30187] Nucleotide sequences of the VGAM769 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM769 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM769 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM769 are further described hereinbelow with reference to Table 1.

[30188] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM769 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM769 RNA, herein designated VGAM RNA, are described hereinbelow with refer-

ence to Table 2.

[30189] As mentioned hereinabove with reference to Fig. 1, a function of VGAM769 gene, herein designated VGAM is inhibition of expression of VGAM769 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM769 correlate with, and may be deduced from, the identity of the target genes which VGAM769 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30190] Ankyrin 2, Neuronal (ANK2, Accession NM\_001148) is a VGAM769 host target gene. ANK2 BINDING SITE1 and ANK2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ANK2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ANK2 BINDING SITE1 and ANK2 BINDING SITE2, designated SEQ ID:6820 and SEQ ID:21964 respectively, to the nucleotide sequence of VGAM769 RNA, herein designated VGAM RNA, also designated SEQ ID:3480.

[30191] A function of VGAM769 is therefore inhibition of Ankyrin 2, Neuronal (ANK2, Accession NM\_001148), a gene which attaches integral membrane proteins to cytoskeletal ele-

ments. also binds to cytoskeletal proteins. Accordingly, utilities of VGAM769 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANK2. The function of ANK2 has been established by previous studies. Tse et al. (1991) studied immunoreactive isoforms of erythrocyte ankyrin found in nonerythroid tissues. Using an erythrocyte ankyrin cDNA clone as a hybridization probe, they isolated a clone from a human genomic library that hybridized at low but not at high stringency. Further studies suggested that the clone represented part of a gene for nonerythroid ankyrin, which they designated ANK2. By analysis of somatic cell hybrids and by fluorescence in situ hybridization, they assigned ANK2 to 4q25–q27. Otto et al. (1991) isolated and sequenced cDNAs related to 2 brain ankyrin isoforms and showed that they are produced through alternative splicing of the mRNA from a single gene. By analysis of human/rodent cell hybrids, Otto et al. (1991) assigned the brain ankyrin gene to chromosome 4.

[30192] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[30193] Otto, E.; Kunitomo, M.; McLaughlin, T.; Bennett, V. : Isola-

tion and characterization of cDNAs encoding human brain ankyrins reveal a family of alternatively spliced genes. J. Cell Biol. 114: 241–253, 1991. ; and

[30194] Tse, W. T.; Menninger, J. C.; Yang–Feng, T. L.; Francke, U.; Sahr, K. E.; Lux, S. E.; Ward, D. C.; Forget, B. G. : Isolation and chromosomal localization of a novel non–erythroid ankyri.

[30195] Further studies establishing the function and utilities of ANK2 are found in John Hopkins OMIM database record ID 106410, and in cited publications numbered 4840–4841 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Transmembrane 4 Superfamily Member 6 (TM4SF6, Accession NM\_003270) is another VGAM769 host target gene. TM4SF6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TM4SF6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TM4SF6 BINDING SITE, designated SEQ ID:9283, to the nucleotide sequence of VGAM769 RNA, herein designated VGAM RNA, also designated SEQ ID:3480.

[30196] Another function of VGAM769 is therefore inhibition of

Transmembrane 4 Superfamily Member 6 (TM4SF6, Accession NM\_003270), a gene which plays a role in the regulation of cell development, activation, growth and motility. Accordingly, utilities of VGAM769 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TM4SF6. The function of TM4SF6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM84.FLJ12595 (Accession NM\_024994) is another VGAM769 host target gene. FLJ12595 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12595, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12595 BINDING SITE, designated SEQ ID:24556, to the nucleotide sequence of VGAM769 RNA, herein designated VGAM RNA, also designated SEQ ID:3480.

[30197] Another function of VGAM769 is therefore inhibition of FLJ12595 (Accession NM\_024994). Accordingly, utilities of VGAM769 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12595.

KIAA1582 (Accession XM\_037262) is another VGAM769 host target gene. KIAA1582 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1582, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1582 BINDING SITE, designated SEQ ID:32591, to the nucleotide sequence of VGAM769 RNA, herein designated VGAM RNA, also designated SEQ ID:3480.

[30198] Another function of VGAM769 is therefore inhibition of KIAA1582 (Accession XM\_037262). Accordingly, utilities of VGAM769 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1582. LOC196993 (Accession XM\_116971) is another VGAM769 host target gene. LOC196993 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC196993, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196993 BINDING SITE, designated SEQ ID:43159, to the nucleotide sequence of VGAM769 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3480.

[30199] Another function of VGAM769 is therefore inhibition of LOC196993 (Accession XM\_116971). Accordingly, utilities of VGAM769 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196993. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 770 (VGAM770) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30200] VGAM770 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM770 was detected is described hereinabove with reference to Figs. 1–8.

[30201] VGAM770 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Coronavirus. VGAM770 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30202] VGAM770 gene encodes a VGAM770 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM770 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM770 precursor RNA is designated SEQ ID:756, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:756 is located at position 13249 relative to the genome of Bovine Coronavirus.

[30203] VGAM770 precursor RNA folds onto itself, forming VGAM770 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30204] An enzyme complex designated DICER COMPLEX, `dices` the VGAM770 folded precursor RNA into VGAM770 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM770 RNA is designated SEQ ID:3481, and is provided hereinbelow with reference to the sequence listing part.

[30205] VGAM770 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM770 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM770 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[30206] VGAM770 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM770 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM770 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM770 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM770 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[30207] The complementary binding of VGAM770 RNA, herein designated VGAM RNA, to host target binding sites on VGAM770 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM770 host target RNA into VGAM770 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30208] It is appreciated that VGAM770 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM770 host target genes. The mRNA of

each one of this plurality of VGAM770 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM770 RNA, herein designated VGAM RNA, and which when bound by VGAM770 RNA causes inhibition of translation of respective one or more VGAM770 host target proteins.

[30209] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM770 gene, herein designated VGAM GENE, on one or more VGAM770 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[30210] It is yet further appreciated that a function of VGAM770 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM770 include diagnosis, prevention and treatment of viral infection by Bovine Coronavirus. Specific functions, and accordingly utilities, of VGAM770 correlate with, and may be deduced from, the identity of the host target genes which VGAM770 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30211] Nucleotide sequences of the VGAM770 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM770 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM770 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM770 are further described hereinbelow with reference to Table 1.

[30212] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM770 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM770 RNA, herein desig-

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[30213] As mentioned hereinabove with reference to Fig. 1, a function of VGAM770 gene, herein designated VGAM is inhibition of expression of VGAM770 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM770 correlate with, and may be deduced from, the identity of the target genes which VGAM770 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30214] Glutamate Receptor, Metabotropic 7 (GRM7, Accession NM\_000844) is a VGAM770 host target gene. GRM7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GRM7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRM7 BINDING SITE, designated SEQ ID:6518, to the nucleotide sequence of VGAM770 RNA, herein designated VGAM RNA, also designated SEQ ID:3481.

[30215] A function of VGAM770 is therefore inhibition of Glutamate Receptor, Metabotropic 7 (GRM7, Accession NM\_000844), a gene which is mediated by a g-protein

that inhibits adenylate cyclase activity. Accordingly, utilities of VGAM770 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRM7. The function of GRM7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM746. Mannosyl (alpha-1,6-)-glycoprotein Beta-1,6-N-acetyl-glucosaminyltransferase (MGAT5, Accession NM\_002410) is another VGAM770 host target gene. MGAT5 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGAT5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGAT5 BINDING SITE, designated SEQ ID:8240, to the nucleotide sequence of VGAM770 RNA, herein designated VGAM RNA, also designated SEQ ID:3481.

[30216] Another function of VGAM770 is therefore inhibition of Mannosyl (alpha-1,6-)-glycoprotein Beta-1,6-N-acetyl-glucosaminyltransferase (MGAT5, Accession NM\_002410). Accordingly, utilities of VGAM770 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with MGAT5. X-box Binding Protein 1 (XBP1, Accession NM\_005080) is another VGAM770 host target gene. XBP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by XBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of XBP1 BINDING SITE, designated SEQ ID:11533, to the nucleotide sequence of VGAM770 RNA, herein designated VGAM RNA, also designated SEQ ID:3481.

[30217] Another function of VGAM770 is therefore inhibition of X-box Binding Protein 1 (XBP1, Accession NM\_005080), a gene which has a role in transcriptional regulation. Accordingly, utilities of VGAM770 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XBP1. The function of XBP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM746.DKFZP434B044 (Accession NM\_031476) is another VGAM770 host target gene. DKFZP434B044 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA en-

coded by DKFZP434B044, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434B044 BINDING SITE, designated SEQ ID:25553, to the nucleotide sequence of VGAM770 RNA, herein designated VGAM RNA, also designated SEQ ID:3481.

[30218] Another function of VGAM770 is therefore inhibition of DKFZP434B044 (Accession NM\_031476). Accordingly, utilities of VGAM770 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434B044. FLJ12806 (Accession NM\_022831) is another VGAM770 host target gene. FLJ12806 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12806, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12806 BINDING SITE, designated SEQ ID:23112, to the nucleotide sequence of VGAM770 RNA, herein designated VGAM RNA, also designated SEQ ID:3481.

[30219] Another function of VGAM770 is therefore inhibition of FLJ12806 (Accession NM\_022831). Accordingly, utilities of

VGAM770 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12806. FLJ22635 (Accession NM\_025092) is another VGAM770 host target gene. FLJ22635 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ22635, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22635 BINDING SITE, designated SEQ ID:24716, to the nucleotide sequence of VGAM770 RNA, herein designated VGAM RNA, also designated SEQ ID:3481.

[30220] Another function of VGAM770 is therefore inhibition of FLJ22635 (Accession NM\_025092). Accordingly, utilities of VGAM770 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22635. FLJ23604 (Accession NM\_025064) is another VGAM770 host target gene. FLJ23604 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23604, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23604 BINDING SITE,

designated SEQ ID:24661, to the nucleotide sequence of VGAM770 RNA, herein designated VGAM RNA, also designated SEQ ID:3481.

[30221] Another function of VGAM770 is therefore inhibition of FLJ23604 (Accession NM\_025064). Accordingly, utilities of VGAM770 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23604. KIAA0557 (Accession XM\_085507) is another VGAM770 host target gene. KIAA0557 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0557, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0557 BINDING SITE, designated SEQ ID:38202, to the nucleotide sequence of VGAM770 RNA, herein designated VGAM RNA, also designated SEQ ID:3481.

[30222] Another function of VGAM770 is therefore inhibition of KIAA0557 (Accession XM\_085507). Accordingly, utilities of VGAM770 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0557. LOC144742 (Accession XM\_084949) is another VGAM770 host target gene. LOC144742 BINDING SITE is

HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC144742, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144742 BINDING SITE, designated SEQ ID:37777, to the nucleotide sequence of VGAM770 RNA, herein designated VGAM RNA, also designated SEQ ID:3481.

[30223] Another function of VGAM770 is therefore inhibition of LOC144742 (Accession XM\_084949). Accordingly, utilities of VGAM770 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144742. LOC145842 (Accession XM\_085254) is another VGAM770 host target gene. LOC145842 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145842, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145842 BINDING SITE, designated SEQ ID:37997, to the nucleotide sequence of VGAM770 RNA, herein designated VGAM RNA, also designated SEQ ID:3481.

[30224] Another function of VGAM770 is therefore inhibition of

LOC145842 (Accession XM\_085254). Accordingly, utilities of VGAM770 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145842. LOC153711 (Accession XM\_098419) is another VGAM770 host target gene. LOC153711 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153711, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153711 BINDING SITE, designated SEQ ID:41668, to the nucleotide sequence of VGAM770 RNA, herein designated VGAM RNA, also designated SEQ ID:3481.

[30225] Another function of VGAM770 is therefore inhibition of LOC153711 (Accession XM\_098419). Accordingly, utilities of VGAM770 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153711. LOC51008 (Accession NM\_015947) is another VGAM770 host target gene. LOC51008 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51008, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of LOC51008 BINDING SITE, designated SEQ ID:18064, to the nucleotide sequence of VGAM770 RNA, herein designated VGAM RNA, also designated SEQ ID:3481.

[30226] Another function of VGAM770 is therefore inhibition of LOC51008 (Accession NM\_015947). Accordingly, utilities of VGAM770 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51008. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 771 (VGAM771) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30227] VGAM771 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM771 was detected is described hereinabove with reference to Figs. 1–8.

[30228] VGAM771 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Coronavirus. VGAM771 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[30229] VGAM771 gene encodes a VGAM771 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM771 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM771 precursor RNA is designated SEQ ID:757, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:757 is located at position 25459 relative to the genome of Bovine Coronavirus.

[30230] VGAM771 precursor RNA folds onto itself, forming VGAM771 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30231] An enzyme complex designated DICER COMPLEX, `dices` the VGAM771 folded precursor RNA into VGAM771 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 65%) nucleotide sequence of VGAM771 RNA is designated SEQ ID:3482, and is provided hereinbelow with reference to the sequence listing part.

[30232] VGAM771 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM771 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM771 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[30233] VGAM771 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM771 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM771 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM771 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM771 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[30234] The complementary binding of VGAM771 RNA, herein designated VGAM RNA, to host target binding sites on VGAM771 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM771 host target RNA into VGAM771 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30235] It is appreciated that VGAM771 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM771 host target genes. The mRNA of each one of this plurality of VGAM771 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM771 RNA, herein designated VGAM RNA, and which when bound by VGAM771 RNA causes inhibition of translation of respective one or more VGAM771 host target proteins.

[30236] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM771 gene, herein designated VGAM GENE, on one or more VGAM771 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[30237] It is yet further appreciated that a function of VGAM771 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM771 include diagnosis, prevention and treatment of viral infection by Bovine Coronavirus. Specific functions, and accordingly utilities, of VGAM771 correlate with, and may be deduced from, the identity of the host target genes which VGAM771 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30238] Nucleotide sequences of the VGAM771 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM771 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM771 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM771 are further described hereinbelow with reference to Table 1.

[30239] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM771 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM771 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30240] As mentioned hereinabove with reference to Fig. 1, a function of VGAM771 gene, herein designated VGAM is inhibition of expression of VGAM771 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM771 correlate with, and may be deduced from, the identity of the target genes which VGAM771 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30241] Dystrophin (muscular dystrophy, Duchenne and Becker types) (DMD, Accession NM\_000109) is a VGAM771 host target gene. DMD BINDING SITE1 through DMD BINDING SITE13 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DMD, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DMD BINDING SITE1 through DMD BINDING SITE13, designated SEQ ID:5569, SEQ ID:10154, SEQ ID:10159, SEQ ID:10166, SEQ

ID:10172, SEQ ID:10180, SEQ ID:10185, SEQ ID:10191, SEQ ID:10202, SEQ ID:10207, SEQ ID:10212, SEQ ID:10218 and SEQ ID:10230 respectively, to the nucleotide sequence of VGAM771 RNA, herein designated VGAM RNA, also designated SEQ ID:3482.

[30242] A function of VGAM771 is therefore inhibition of Dystrophin (muscular dystrophy, Duchenne and Becker types) (DMD, Accession NM\_000109), a gene which muscular dystrophy . Accordingly, utilities of VGAM771 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DMD. The function of DMD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM218.KIAA1219 (Accession XM\_028835) is another VGAM771 host target gene. KIAA1219 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1219, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1219 BINDING SITE, designated SEQ ID:30755, to the nucleotide sequence of VGAM771 RNA, herein designated

VGAM RNA, also designated SEQ ID:3482.

[30243] Another function of VGAM771 is therefore inhibition of KIAA1219 (Accession XM\_028835). Accordingly, utilities of VGAM771 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1219. LOC92979 (Accession NM\_138396) is another VGAM771 host target gene. LOC92979 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92979, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92979 BINDING SITE, designated SEQ ID:28764, to the nucleotide sequence of VGAM771 RNA, herein designated VGAM RNA, also designated SEQ ID:3482.

[30244] Another function of VGAM771 is therefore inhibition of LOC92979 (Accession NM\_138396). Accordingly, utilities of VGAM771 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92979. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 772 (VGAM772) viral gene, which modu-

lates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30245] VGAM772 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM772 was detected is described hereinabove with reference to Figs. 1–8.

[30246] VGAM772 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Coronavirus. VGAM772 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30247] VGAM772 gene encodes a VGAM772 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM772 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM772 precursor RNA is designated SEQ ID:758, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:758 is located at position 24433 relative to the genome of Bovine Coronavirus.

[30248] VGAM772 precursor RNA folds onto itself, forming

VGAM772 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30249] An enzyme complex designated DICER COMPLEX, `dices` the VGAM772 folded precursor RNA into VGAM772 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM772 RNA is designated SEQ ID:3483, and is provided hereinbelow with reference to the sequence listing part.

[30250] VGAM772 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM772 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM772 host target RNA comprises

three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[30251] VGAM772 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM772 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM772 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM772 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM772 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[30252] The complementary binding of VGAM772 RNA, herein designated VGAM RNA, to host target binding sites on VGAM772 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM772 host target RNA into VGAM772 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30253] It is appreciated that VGAM772 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM772 host target genes. The mRNA of each one of this plurality of VGAM772 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM772 RNA, herein designated VGAM RNA, and which when bound by VGAM772 RNA causes inhibition of translation of respective one or more VGAM772 host target proteins.

[30254] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM772 gene, herein designated VGAM GENE, on one or more VGAM772 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[30255] It is yet further appreciated that a function of VGAM772 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM772 include diagnosis, prevention and treatment of viral infection by Bovine Coronavirus. Specific functions, and accordingly utilities, of VGAM772 correlate with, and may be deduced from, the identity of the host target genes which VGAM772 binds and inhibits, and the

function of these host target genes, as elaborated herein–below.

[30256] Nucleotide sequences of the VGAM772 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM772 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM772 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM772 are further described hereinbelow with reference to Table 1.

[30257] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM772 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM772 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30258] As mentioned hereinabove with reference to Fig. 1, a function of VGAM772 gene, herein designated VGAM is inhibition of expression of VGAM772 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM772 correlate with, and may be deduced from, the identity of the target genes which VGAM772 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[30259] FLJ10178 (Accession NM\_018015) is a VGAM772 host target gene. FLJ10178 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10178, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10178 BINDING SITE, designated SEQ ID:19755, to the nucleotide sequence of VGAM772 RNA, herein designated VGAM RNA, also designated SEQ ID:3483.

[30260] A function of VGAM772 is therefore inhibition of FLJ10178 (Accession NM\_018015). Accordingly, utilities of VGAM772 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10178. LOC158014 (Accession XM\_088442) is another VGAM772 host target gene. LOC158014 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158014 BINDING SITE, designated SEQ ID:39695, to the nucleotide se-

quence of VGAM772 RNA, herein designated VGAM RNA, also designated SEQ ID:3483.

[30261] Another function of VGAM772 is therefore inhibition of LOC158014 (Accession XM\_088442). Accordingly, utilities of VGAM772 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158014. LOC255231 (Accession XM\_170908) is another VGAM772 host target gene. LOC255231 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255231, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255231 BINDING SITE, designated SEQ ID:45670, to the nucleotide sequence of VGAM772 RNA, herein designated VGAM RNA, also designated SEQ ID:3483.

[30262] Another function of VGAM772 is therefore inhibition of LOC255231 (Accession XM\_170908). Accordingly, utilities of VGAM772 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255231. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 773 (VGAM773) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30263] VGAM773 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM773 was detected is described hereinabove with reference to Figs. 1–8.

[30264] VGAM773 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Coronavirus. VGAM773 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30265] VGAM773 gene encodes a VGAM773 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM773 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM773 precursor RNA is designated SEQ ID:759, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:759 is located at position 23974 relative to the genome of Bovine Coronavirus.

[30266] VGAM773 precursor RNA folds onto itself, forming VGAM773 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30267] An enzyme complex designated DICER COMPLEX, `dices` the VGAM773 folded precursor RNA into VGAM773 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM773 RNA is designated SEQ ID:3484, and is provided hereinbelow with reference to the sequence listing part.

[30268] VGAM773 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM773 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM773 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[30269] VGAM773 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM773 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM773 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM773 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM773 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[30270] The complementary binding of VGAM773 RNA, herein designated VGAM RNA, to host target binding sites on VGAM773 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM773 host target RNA into VGAM773 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30271] It is appreciated that VGAM773 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM773 host target genes. The mRNA of each one of this plurality of VGAM773 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM773 RNA, herein designated VGAM RNA, and which when bound by VGAM773 RNA causes inhibition of translation of respective one or more VGAM773 host target proteins.

[30272] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM773 gene, herein designated VGAM GENE, on one or more VGAM773 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[30273] It is yet further appreciated that a function of VGAM773 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM773 include diagnosis, prevention and treatment of viral infection by Bovine Coronavirus. Specific functions, and accordingly utilities, of VGAM773 correlate with, and may be deduced from, the identity of the host

target genes which VGAM773 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30274] Nucleotide sequences of the VGAM773 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM773 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM773 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM773 are further described hereinbelow with reference to Table 1.

[30275] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM773 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM773 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30276] As mentioned hereinabove with reference to Fig. 1, a function of VGAM773 gene, herein designated VGAM is inhibition of expression of VGAM773 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM773 correlate with, and may be deduced from, the identity of the target genes which VGAM773

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30277] Fanconi Anemia, Complementation Group F (FANCF, Accession NM\_022725) is a VGAM773 host target gene. FANCF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FANCF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FANCF BINDING SITE, designated SEQ ID:22926, to the nucleotide sequence of VGAM773 RNA, herein designated VGAM RNA, also designated SEQ ID:3484.

[30278] A function of VGAM773 is therefore inhibition of Fanconi Anemia, Complementation Group F (FANCF, Accession NM\_022725). Accordingly, utilities of VGAM773 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FANCF. NCK-associated Protein 1 (NCKAP1, Accession NM\_013436) is another VGAM773 host target gene. NCKAP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NCKAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCKAP1 BINDING SITE, designated SEQ ID:15097, to the nucleotide sequence of VGAM773 RNA, herein designated VGAM RNA, also designated SEQ ID:3484.

[30279] Another function of VGAM773 is therefore inhibition of NCK-associated Protein 1 (NCKAP1, Accession NM\_013436). Accordingly, utilities of VGAM773 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCKAP1. Spinocerebellar Ataxia 7 (olivopontocerebellar atrophy with retinal degeneration) (SCA7, Accession NM\_000333) is another VGAM773 host target gene. SCA7 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SCA7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCA7 BINDING SITE, designated SEQ ID:5887, to the nucleotide sequence of VGAM773 RNA, herein designated VGAM RNA, also designated SEQ ID:3484.

[30280] Another function of VGAM773 is therefore inhibition of Spinocerebellar Ataxia 7 (olivopontocerebellar atrophy

with retinal degeneration) (SCA7, Accession NM\_000333). Accordingly, utilities of VGAM773 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCA7. FLJ11259 (Accession NM\_018370) is another VGAM773 host target gene. FLJ11259 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11259, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11259 BINDING SITE, designated SEQ ID:20388, to the nucleotide sequence of VGAM773 RNA, herein designated VGAM RNA, also designated SEQ ID:3484.

[30281] Another function of VGAM773 is therefore inhibition of FLJ11259 (Accession NM\_018370). Accordingly, utilities of VGAM773 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11259. FLJ20139 (Accession NM\_017685) is another VGAM773 host target gene. FLJ20139 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20139, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of FLJ20139 BINDING SITE, designated SEQ ID:19237, to the nucleotide sequence of VGAM773 RNA, herein designated VGAM RNA, also designated SEQ ID:3484.

[30282] Another function of VGAM773 is therefore inhibition of FLJ20139 (Accession NM\_017685). Accordingly, utilities of VGAM773 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20139. KIAA0853 (Accession NM\_015070) is another VGAM773 host target gene. KIAA0853 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0853, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0853 BINDING SITE, designated SEQ ID:17439, to the nucleotide sequence of VGAM773 RNA, herein designated VGAM RNA, also designated SEQ ID:3484.

[30283] Another function of VGAM773 is therefore inhibition of KIAA0853 (Accession NM\_015070). Accordingly, utilities of VGAM773 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0853. KIAA1189 (Accession XM\_050508) is another

VGAM773 host target gene. KIAA1189 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1189, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1189 BINDING SITE, designated SEQ ID:35654, to the nucleotide sequence of VGAM773 RNA, herein designated VGAM RNA, also designated SEQ ID:3484.

[30284] Another function of VGAM773 is therefore inhibition of KIAA1189 (Accession XM\_050508). Accordingly, utilities of VGAM773 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1189. KIAA1423 (Accession XM\_029703) is another VGAM773 host target gene. KIAA1423 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1423, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1423 BINDING SITE, designated SEQ ID:30924, to the nucleotide sequence of VGAM773 RNA, herein designated VGAM RNA, also designated SEQ ID:3484.

[30285] Another function of VGAM773 is therefore inhibition of KIAA1423 (Accession XM\_029703). Accordingly, utilities of VGAM773 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1423. LOC143879 (Accession XM\_084666) is another VGAM773 host target gene. LOC143879 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC143879, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143879 BINDING SITE, designated SEQ ID:37663, to the nucleotide sequence of VGAM773 RNA, herein designated VGAM RNA, also designated SEQ ID:3484.

[30286] Another function of VGAM773 is therefore inhibition of LOC143879 (Accession XM\_084666). Accordingly, utilities of VGAM773 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143879. LOC152905 (Accession XM\_017966) is another VGAM773 host target gene. LOC152905 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152905, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152905 BINDING SITE, designated SEQ ID:30333, to the nucleotide sequence of VGAM773 RNA, herein designated VGAM RNA, also designated SEQ ID:3484.

[30287] Another function of VGAM773 is therefore inhibition of LOC152905 (Accession XM\_017966). Accordingly, utilities of VGAM773 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152905. LOC170395 (Accession XM\_084325) is another VGAM773 host target gene. LOC170395 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC170395, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC170395 BINDING SITE, designated SEQ ID:37547, to the nucleotide sequence of VGAM773 RNA, herein designated VGAM RNA, also designated SEQ ID:3484.

[30288] Another function of VGAM773 is therefore inhibition of LOC170395 (Accession XM\_084325). Accordingly, utilities of VGAM773 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC170395. LOC200268 (Accession XM\_114178) is another VGAM773 host target gene. LOC200268 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200268, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200268 BINDING SITE, designated SEQ ID:42764, to the nucleotide sequence of VGAM773 RNA, herein designated VGAM RNA, also designated SEQ ID:3484.

[30289] Another function of VGAM773 is therefore inhibition of LOC200268 (Accession XM\_114178). Accordingly, utilities of VGAM773 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200268. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 774 (VGAM774) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30290] VGAM774 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM774 was detected is described hereinabove with reference to Figs. 1–8.

[30291] VGAM774 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Coronavirus.

VGAM774 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30292] VGAM774 gene encodes a VGAM774 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM774 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM774 precursor RNA is designated SEQ ID:760, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:760 is located at position 23642 relative to the genome of Bovine Coronavirus.

[30293] VGAM774 precursor RNA folds onto itself, forming VGAM774 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence

of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30294] An enzyme complex designated DICER COMPLEX, `dices` the VGAM774 folded precursor RNA into VGAM774 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM774 RNA is designated SEQ ID:3485, and is provided hereinbelow with reference to the sequence listing part.

[30295] VGAM774 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM774 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM774 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[30296] VGAM774 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM774 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM774 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM774 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM774 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[30297] The complementary binding of VGAM774 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM774 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM774 host target RNA into VGAM774 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30298] It is appreciated that VGAM774 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM774 host target genes. The mRNA of each one of this plurality of VGAM774 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM774 RNA, herein designated VGAM RNA, and which when bound by VGAM774 RNA causes inhibition of translation of respective one or more VGAM774 host target proteins.

[30299] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM774 gene, herein designated VGAM GENE, on one or more VGAM774 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[30300] It is yet further appreciated that a function of VGAM774 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM774 include diagnosis, prevention and treatment of viral infection by Bovine Coronavirus. Specific functions, and accordingly utilities, of VGAM774 correlate with, and may be deduced from, the identity of the host target genes which VGAM774 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30301] Nucleotide sequences of the VGAM774 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM774 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM774 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM774 are further described hereinbelow with reference to Table 1.

[30302] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM774 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM774 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30303] As mentioned hereinabove with reference to Fig. 1, a function of VGAM774 gene, herein designated VGAM is inhibition of expression of VGAM774 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM774 correlate with, and may be deduced from, the identity of the target genes which VGAM774 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30304] Eukaryotic Translation Initiation Factor 1A (EIF1A, Accession XM\_114147) is a VGAM774 host target gene. EIF1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EIF1A, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EIF1A BINDING SITE, designated SEQ ID:42724, to the nucleotide sequence of VGAM774 RNA, herein designated VGAM RNA, also designated SEQ ID:3485.

[30305] A function of VGAM774 is therefore inhibition of Eukaryotic Translation Initiation Factor 1A (EIF1A, Accession XM\_114147), a gene which seems to be required for maximal rate of protein biosynthesis. Accordingly, utilities of VGAM774 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF1A. The function of EIF1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM120. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 775 (VGAM775) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30306] VGAM775 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM775 was detected is described hereinabove with reference to Figs. 1–8.

[30307] VGAM775 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Coronavirus. VGAM775 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30308] VGAM775 gene encodes a VGAM775 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM775 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM775 precursor RNA is designated SEQ ID:761, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:761 is located at position 24623 relative to the genome of Bovine Coronavirus.

[30309] VGAM775 precursor RNA folds onto itself, forming VGAM775 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA

genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30310] An enzyme complex designated DICER COMPLEX, `dices` the VGAM775 folded precursor RNA into VGAM775 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM775 RNA is designated SEQ ID:3486, and is provided hereinbelow with reference to the sequence listing part.

[30311] VGAM775 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM775 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM775 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[30312] VGAM775 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM775 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM775 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM775 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM775 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[30313] The complementary binding of VGAM775 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM775 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM775 host target RNA into VGAM775 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30314] It is appreciated that VGAM775 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM775 host target genes. The mRNA of each one of this plurality of VGAM775 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM775 RNA, herein designated VGAM RNA, and which when bound by VGAM775 RNA causes inhibition of translation of respective one or more VGAM775 host target proteins.

[30315] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM775 gene, herein designated VGAM GENE, on one or more VGAM775 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[30316] It is yet further appreciated that a function of VGAM775 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM775 include diagnosis, prevention and treatment of viral infection by Bovine Coronavirus. Specific functions, and accordingly utilities, of VGAM775 correlate with, and may be deduced from, the identity of the host target genes which VGAM775 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30317] Nucleotide sequences of the VGAM775 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM775 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM775 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM775 are further described hereinbelow with reference to Table 1.

[30318] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM775 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM775 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30319] As mentioned hereinabove with reference to Fig. 1, a function of VGAM775 gene, herein designated VGAM is inhibition of expression of VGAM775 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM775 correlate with, and may be deduced from, the identity of the target genes which VGAM775 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30320] Tissue Inhibitor of Metalloproteinase 3 (Sorsby fundus dystrophy, pseudoinflammatory) (TIMP3, Accession NM\_000362) is a VGAM775 host target gene. TIMP3 BIND-

ING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TIMP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIMP3 BINDING SITE, designated SEQ ID:5926, to the nucleotide sequence of VGAM775 RNA, herein designated VGAM RNA, also designated SEQ ID:3486.

[30321] A function of VGAM775 is therefore inhibition of Tissue Inhibitor of Metalloproteinase 3 (Sorsby fundus dystrophy, pseudoinflammatory) (TIMP3, Accession NM\_000362). Accordingly, utilities of VGAM775 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIMP3. LOC90785 (Accession XM\_034110) is another VGAM775 host target gene. LOC90785 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90785, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90785 BINDING SITE, designated SEQ ID:32006, to the nucleotide sequence of VGAM775 RNA, herein designated VGAM RNA, also designated SEQ ID:3486.

[30322] Another function of VGAM775 is therefore inhibition of LOC90785 (Accession XM\_034110). Accordingly, utilities of VGAM775 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90785. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 776 (VGAM776) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30323] VGAM776 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM776 was detected is described hereinabove with reference to Figs. 1–8.

[30324] VGAM776 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Culex Nigripalpus Baculovirus. VGAM776 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30325] VGAM776 gene encodes a VGAM776 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM776

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM776 precursor RNA is designated SEQ ID:762, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:762 is located at position 29557 relative to the genome of Culex Nigripalpus Baculovirus.

[30326] VGAM776 precursor RNA folds onto itself, forming VGAM776 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30327] An enzyme complex designated DICER COMPLEX, `dices` the VGAM776 folded precursor RNA into VGAM776 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 83%) nucleotide sequence of VGAM776 RNA is designated SEQ ID:3487, and is provided hereinbelow with reference to the sequence listing part.

[30328] VGAM776 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM776 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM776 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[30329] VGAM776 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM776 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM776 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM776 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM776 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[30330] The complementary binding of VGAM776 RNA, herein designated VGAM RNA, to host target binding sites on VGAM776 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM776 host target RNA into VGAM776 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30331] It is appreciated that VGAM776 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM776 host target genes. The mRNA of each one of this plurality of VGAM776 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM776 RNA, herein designated VGAM RNA, and which when bound by VGAM776 RNA causes inhibition of translation of respective one or more VGAM776 host target proteins.

[30332] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM776 gene, herein designated VGAM GENE, on one or more VGAM776 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[30333] It is yet further appreciated that a function of VGAM776 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM776 include diagnosis, prevention and treatment of viral infection by Culex Nigripalpus Baculovirus. Specific functions, and accordingly utilities, of VGAM776 correlate with, and may be deduced from, the identity of the host target genes which VGAM776 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30334] Nucleotide sequences of the VGAM776 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM776 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM776 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM776 are further described hereinbelow with reference to Table 1.

[30335] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM776 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM776 RNA, herein designated VGAM RNA, are described hereinbelow with refer-

ence to Table 2.

[30336] As mentioned hereinabove with reference to Fig. 1, a function of VGAM776 gene, herein designated VGAM is inhibition of expression of VGAM776 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM776 correlate with, and may be deduced from, the identity of the target genes which VGAM776 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30337] KIAA0826 (Accession XM\_093839) is a VGAM776 host target gene. KIAA0826 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0826, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0826 BINDING SITE, designated SEQ ID:40216, to the nucleotide sequence of VGAM776 RNA, herein designated VGAM RNA, also designated SEQ ID:3487.

[30338] A function of VGAM776 is therefore inhibition of KIAA0826 (Accession XM\_093839). Accordingly, utilities of VGAM776 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0826. MGC2654 (Accession NM\_024109) is another VGAM776 host target gene. MGC2654 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC2654, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2654 BINDING SITE, designated SEQ ID:23554, to the nucleotide sequence of VGAM776 RNA, herein designated VGAM RNA, also designated SEQ ID:3487.

[30339] Another function of VGAM776 is therefore inhibition of MGC2654 (Accession NM\_024109). Accordingly, utilities of VGAM776 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2654. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 777 (VGAM777) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30340] VGAM777 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM777 was detected is described hereinabove with reference to Figs. 1–8.

[30341] VGAM777 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Culex Nigripalpus Baculovirus. VGAM777 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30342] VGAM777 gene encodes a VGAM777 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM777 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM777 precursor RNA is designated SEQ ID:763, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:763 is located at position 71215 relative to the genome of Culex Nigripalpus Baculovirus.

[30343] VGAM777 precursor RNA folds onto itself, forming VGAM777 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence

of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30344] An enzyme complex designated DICER COMPLEX, `dices` the VGAM777 folded precursor RNA into VGAM777 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM777 RNA is designated SEQ ID:3488, and is provided hereinbelow with reference to the sequence listing part.

[30345] VGAM777 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM777 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM777 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[30346] VGAM777 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM777 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM777 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM777 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM777 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[30347] The complementary binding of VGAM777 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM777 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM777 host target RNA into VGAM777 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30348] It is appreciated that VGAM777 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM777 host target genes. The mRNA of each one of this plurality of VGAM777 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM777 RNA, herein designated VGAM RNA, and which when bound by VGAM777 RNA causes inhibition of translation of respective one or more VGAM777 host target proteins.

[30349] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM777 gene, herein designated VGAM GENE, on one or more VGAM777 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[30350] It is yet further appreciated that a function of VGAM777 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM777 include diagnosis, prevention and treatment of viral infection by Culex Nigripalpus Baculovirus. Specific functions, and accordingly utilities, of VGAM777 correlate with, and may be deduced from, the identity of the host target genes which VGAM777 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30351] Nucleotide sequences of the VGAM777 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM777 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM777 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM777 are further described hereinbelow with reference to Table 1.

[30352] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM777 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM777 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30353] As mentioned hereinabove with reference to Fig. 1, a function of VGAM777 gene, herein designated VGAM is inhibition of expression of VGAM777 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM777 correlate with, and may be deduced from, the identity of the target genes which VGAM777 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30354] Ankyrin 1, Erythrocytic (ANK1, Accession XM\_016774) is a VGAM777 host target gene. ANK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ANK1, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ANK1 BINDING SITE, designated SEQ ID:30288, to the nucleotide sequence of VGAM777 RNA, herein designated VGAM RNA, also designated SEQ ID:3488.

[30355] A function of VGAM777 is therefore inhibition of Ankyrin 1, Erythrocytic (ANK1, Accession XM\_016774). Accordingly, utilities of VGAM777 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANK1. Glycogenin (GYG, Accession NM\_004130) is another VGAM777 host target gene. GYG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GYG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GYG BINDING SITE, designated SEQ ID:10339, to the nucleotide sequence of VGAM777 RNA, herein designated VGAM RNA, also designated SEQ ID:3488.

[30356] Another function of VGAM777 is therefore inhibition of Glycogenin (GYG, Accession NM\_004130), a gene which primes de novo glycogen synthesis. Accordingly, utilities

of VGAM777 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GYG. The function of GYG has been established by previous studies. Glycogenin is a self-glucosylating protein involved in the initiation reactions of glycogen synthesis. During initiation, the covalent attachment of a glucose residue to glycogenin is followed by elongation to form an oligosaccharide chain. Viskupic et al. (1992) isolated cDNAs encoding glycogenin from rabbit muscle, rat, and cow. Recombinant mammalian glycogenin was enzymatically active and capable of self-glucosylation. After incubation with UDP-glucose, the recombinant protein was able to serve as a substrate for glycogen synthase, leading to the production of high M(r) polysaccharide. Barbetti et al. (1996) identified a human glycogenin cDNA. The predicted 333-amino acid human protein shares 93% identity with rabbit muscle glycogenin. Northern blot analysis revealed that the 2.4-kb glycogenin mRNA was expressed prominently in human skeletal muscle and heart, and to a lesser extent in several other tissues. Mu et al. (1997) isolated cDNAs encoding a related protein, which they designated glycogenin-2 (OMIM Ref. No. 300198). They suggested that muscle glycogenin be referred to as glyco-

genin-1.

[30357] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[30358] Barbetti, F.; Rocchi, M.; Bossolasco, M.; Cordera, R.; Sbraccia, P.; Finelli, P.; Consalez, G. G. : The human skeletal muscle glycogenin gene: cDNA, tissue expression, and chromosomal localization. *Biochem. Biophys. Res. Commun.* 220: 72-77, 1996. ; and

[30359] Mu, J.; Skurat, A. V.; Roach, P. J. : Glycogenin-2, a novel self-glucosylating protein involved in liver glycogen biosynthesis. *J. Biol. Chem.* 272: 27589-27597, 1997.

[30360] Further studies establishing the function and utilities of GYG are found in John Hopkins OMIM database record ID 603942, and in cited publications numbered 5043, 518 and 11401 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Heterogeneous Nuclear Ribonucleoprotein F (HNRPF, Accession NM\_004966) is another VGAM777 host target gene. HNRPF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HNRPF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of HNRPF BINDING SITE, designated SEQ ID:11414, to the nucleotide sequence of VGAM777 RNA, herein designated VGAM RNA, also designated SEQ ID:3488.

[30361] Another function of VGAM777 is therefore inhibition of Heterogeneous Nuclear Ribonucleoprotein F (HNRPF, Accession NM\_004966). Accordingly, utilities of VGAM777 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HNRPF. inositol(myo)-1(or 4)-monophosphatase 2 (IMPA2, Accession XM\_170862) is another VGAM777 host target gene. IMPA2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by IMPA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IMPA2 BINDING SITE, designated SEQ ID:45631, to the nucleotide sequence of VGAM777 RNA, herein designated VGAM RNA, also designated SEQ ID:3488.

[30362] Another function of VGAM777 is therefore inhibition of inositol(myo)-1(or 4)-monophosphatase 2 (IMPA2, Accession XM\_170862). Accordingly, utilities of VGAM777 in-

clude diagnosis, prevention and treatment of diseases and clinical conditions associated with IMPA2. MAD, Mothers Against Decapentaplegic Homolog 4 (Drosophila) (MADH4, Accession NM\_005359) is another VGAM777 host target gene. MADH4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MADH4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MADH4 BINDING SITE, designated SEQ ID:11830, to the nucleotide sequence of VGAM777 RNA, herein designated VGAM RNA, also designated SEQ ID:3488.

[30363] Another function of VGAM777 is therefore inhibition of MAD, Mothers Against Decapentaplegic Homolog 4 (Drosophila) (MADH4, Accession NM\_005359), a gene which common mediator of signal transduction by  $\text{tgf-}\beta$  (transforming growth factor) superfamily; smad4 is the common smad (co-smad). promotes binding of the smad2/smad4/fast-1 complex to dna and provides an activation function required for smad1 or smad2 to stimulate transcription. may act as a tumor suppressor. Accordingly, utilities of VGAM777 include diagnosis, prevention

and treatment of diseases and clinical conditions associated with MADH4. The function of MADH4 and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM217. Ribosomal Protein S6 Kinase, 90kDa, Polypeptide 5 (RPS6KA5, Accession NM\_004755) is another VGAM777 host target gene. RPS6KA5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RPS6KA5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RPS6KA5 BINDING SITE, designated SEQ ID:11143, to the nucleotide sequence of VGAM777 RNA, herein designated VGAM RNA, also designated SEQ ID:3488.

[30364] Another function of VGAM777 is therefore inhibition of Ribosomal Protein S6 Kinase, 90kDa, Polypeptide 5 (RPS6KA5, Accession NM\_004755), a gene which plays an essential role in the proliferation of yeast cells. Accordingly, utilities of VGAM777 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPS6KA5. The function of RPS6KA5 and its asso-

ciation with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM191.FLJ20519 (Accession NM\_017860) is another VGAM777 host target gene.

FLJ20519 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20519, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20519 BINDING SITE, designated SEQ ID:19536, to the nucleotide sequence of VGAM777 RNA, herein designated VGAM RNA, also designated SEQ ID:3488.

[30365] Another function of VGAM777 is therefore inhibition of FLJ20519 (Accession NM\_017860). Accordingly, utilities of VGAM777 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20519. HSPC072 (Accession NM\_014162) is another VGAM777 host target gene. HSPC072 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HSPC072, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of HSPC072 BINDING SITE, designated SEQ ID:15460, to the nucleotide sequence of VGAM777 RNA, herein designated VGAM RNA, also designated SEQ ID:3488.

[30366] Another function of VGAM777 is therefore inhibition of HSPC072 (Accession NM\_014162). Accordingly, utilities of VGAM777 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC072. KIAA0678 (Accession XM\_039828) is another VGAM777 host target gene. KIAA0678 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0678, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0678 BINDING SITE, designated SEQ ID:33196, to the nucleotide sequence of VGAM777 RNA, herein designated VGAM RNA, also designated SEQ ID:3488.

[30367] Another function of VGAM777 is therefore inhibition of KIAA0678 (Accession XM\_039828). Accordingly, utilities of VGAM777 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0678. Zinc Finger, DHHC Domain Containing 5

(ZDHHC5, Accession XM\_166204) is another VGAM777 host target gene. ZDHHC5 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ZDHHC5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZDHHC5 BINDING SITE, designated SEQ ID:44007, to the nucleotide sequence of VGAM777 RNA, herein designated VGAM RNA, also designated SEQ ID:3488.

[30368] Another function of VGAM777 is therefore inhibition of Zinc Finger, DHHC Domain Containing 5 (ZDHHC5, Accession XM\_166204). Accordingly, utilities of VGAM777 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZDHHC5. LOC199990 (Accession XM\_114083) is another VGAM777 host target gene. LOC199990 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC199990, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199990 BINDING SITE, designated SEQ ID:42679, to the nucleotide sequence of

VGAM777 RNA, herein designated VGAM RNA, also designated SEQ ID:3488.

[30369] Another function of VGAM777 is therefore inhibition of LOC199990 (Accession XM\_114083). Accordingly, utilities of VGAM777 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199990. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 778 (VGAM778) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30370] VGAM778 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM778 was detected is described hereinabove with reference to Figs. 1–8.

[30371] VGAM778 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Culex Nigripalpus Baculovirus. VGAM778 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30372] VGAM778 gene encodes a VGAM778 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM778 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM778 precursor RNA is designated SEQ ID:764, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:764 is located at position 84607 relative to the genome of Culex Nigripalpus Baculovirus.

[30373] VGAM778 precursor RNA folds onto itself, forming VGAM778 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30374] An enzyme complex designated DICER COMPLEX, `dices` the VGAM778 folded precursor RNA into VGAM778 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of VGAM778 RNA is designated SEQ ID:3489, and is provided hereinbelow with reference to the sequence listing part.

[30375] VGAM778 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM778 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM778 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[30376] VGAM778 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM778 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM778 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM778 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM778 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[30377] The complementary binding of VGAM778 RNA, herein designated VGAM RNA, to host target binding sites on VGAM778 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM778 host target RNA into VGAM778 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30378] It is appreciated that VGAM778 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM778 host target genes. The mRNA of each one of this plurality of VGAM778 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM778 RNA, herein designated VGAM RNA, and which when bound by VGAM778 RNA causes inhibition of translation of respective one or more VGAM778 host target proteins.

[30379] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM778 gene, herein designated VGAM GENE, on one or more VGAM778 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[30380] It is yet further appreciated that a function of VGAM778 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM778 include diagnosis, prevention and treatment of viral infection by Culex Nigripalpus Baculovirus. Specific functions, and accordingly utilities, of VGAM778 correlate with, and may be deduced from, the identity of the host target genes which VGAM778 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30381] Nucleotide sequences of the VGAM778 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM778 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM778 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM778 are further described hereinbelow with reference to Table 1.

[30382] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM778 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM778 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30383] As mentioned hereinabove with reference to Fig. 1, a function of VGAM778 gene, herein designated VGAM is inhibition of expression of VGAM778 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM778 correlate with, and may be deduced from, the identity of the target genes which VGAM778 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30384] Nucleoporin 98kDa (NUP98, Accession NM\_016320) is a VGAM778 host target gene. NUP98 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NUP98, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NUP98 BINDING SITE, designated SEQ ID:18440, to the nucleotide sequence of VGAM778 RNA, herein designated VGAM RNA, also designated SEQ ID:3489.

[30385] A function of VGAM778 is therefore inhibition of Nucleoporin 98kDa (NUP98, Accession NM\_016320), a gene

which functions in the nuclear transport of protein and RNA. Accordingly, utilities of VGAM778 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUP98. The function of NUP98 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM55. Oxytocin Receptor (OXTR, Accession NM\_000916) is another VGAM778 host target gene. OXTR BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by OXTR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OXTR BINDING SITE, designated SEQ ID:6620, to the nucleotide sequence of VGAM778 RNA, herein designated VGAM RNA, also designated SEQ ID:3489.

[30386] Another function of VGAM778 is therefore inhibition of Oxytocin Receptor (OXTR, Accession NM\_000916), a gene which induces inward ion currents. Accordingly, utilities of VGAM778 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OXTR. The function of OXTR and its association with various diseases

and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM636.PR1 (Accession XM\_056490) is another VGAM778 host target gene. PR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PR1 BINDING SITE, designated SEQ ID:36399, to the nucleotide sequence of VGAM778 RNA, herein designated VGAM RNA, also designated SEQ ID:3489.

[30387] Another function of VGAM778 is therefore inhibition of PR1 (Accession XM\_056490), a gene which may function as a hematopoietic receptor. Accordingly, utilities of VGAM778 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PR1. The function of PR1 has been established by previous studies. Using subtractive hybridization of mRNA from polycythemia vera (OMIM Ref. No. 263300) patient granulocytes and mRNA from normal granulocytes, Temerinac et al. (2000) isolated a cDNA encoding NB1, which they called PR1. Northern blot analysis revealed expression of

2.1- and 3.1-kb transcripts in granulocytes from PV patients but not normal granulocytes. Weak expression of PRV1 was seen in a patient with idiopathic myelofibrosis (see OMIM Ref. No. 254450) and in some patients with essential thrombocythemia (see OMIM Ref. No. 187950), but no expression was seen in patients with acute or chronic myelogenous leukemia (see OMIM Ref. No. 601626 and 151410, respectively) or in patients with polycythemic secondary erythrocytosis. Strong expression in bone marrow and slight expression in fetal liver was detected, but PRV1 was not expressed in other tissues. Treatment of normal stem cell donors or, in vitro, normal granulocytes, with GCSF (CSF3; 138970) or CSF2 (OMIM Ref. No. 138960) induced expression initially of the 3.1-kb transcript and, subsequently, the 2.1 kb transcript. The deduced 437-amino acid PRV1 protein contains an N-terminal signal sequence, 2 highly homologous 188-residue cysteine-rich domains that share homology with UPAR domains (see OMIM Ref. No. 606119), and a highly hydrophobic C-terminal sequence probably encoding a GPI link. Western blot and flow cytometric analyses showed cell surface expression of a 60-kD protein, 14 kD greater than the predicted size, probably due to the pres-

ence of 3 potential N-glycosylation sites. Immunohistochemistry demonstrated expression in bone marrow early erythroblasts, megakaryocytes, promyelocytes, and myelocytes. Independently, Kissel et al. (2001) cloned and characterized NB1, which they also referred to as CD177 and HNA2A. They obtained the cDNA after purification and microsequence analysis of NB1 protein from normal resting granulocytes. Kissel et al. (2001) noted amino acid differences between the PRV1 (Temerinac et al., 2000) and NB1 sequences at positions 3, 119, 323, and 379 and suggested that 2 different, highly homologous genes may exist. By genomic sequence analysis and PCR, Kissel et al. (2002) determined that the NB1 gene contains 9 exons. By genomic sequence analysis, Kissel et al. (2001) mapped the NB1 gene to chromosome 19q13.2. Kissel et al. (2002) reported that 2 women with no cell-surface NB1 expression but with NB1-specific alloantibodies after delivery of babies with alloimmune neonatal neutropenia possessed genomic NB1. The authors determined that the NB1-negative phenotype resulted from different off-frame insertions at the RNA level causing an absence of GPI linkage sites and transmembrane segments. Kissel et al. (2002) concluded that any putative soluble fragments

produced were unable to prevent alloimmunization.

[30388] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[30389] Kissel, K.; Santoso, S.; Hofmann, C.; Stroncek, D.; Bux, J. : Molecular basis of the neutrophil glycoprotein NB1 (CD177) involved in the pathogenesis of immune neutropenias and transfusion reactions. *Europ. J. Immun.* 31: 1301–1309, 2001. ; and

[30390] Kissel, K.; Scheffler, S.; Kerowgan, M.; Bux, J. : Molecular basis of NB1 (HNA–2a, CD177) deficiency. *Blood* 99: 4231–4233, 2002.

[30391] Further studies establishing the function and utilities of PRV1 are found in John Hopkins OMIM database record ID 162860, and in cited publications numbered 693–696 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Tissue Inhibitor of Metalloproteinase 3 (Sorsby fundus dystrophy, pseudoinflammatory) (TIMP3, Accession NM\_000362) is another VGAM778 host target gene. TIMP3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TIMP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIMP3 BINDING SITE, designated SEQ ID:5928, to the nucleotide sequence of VGAM778 RNA, herein designated VGAM RNA, also designated SEQ ID:3489.

[30392] Another function of VGAM778 is therefore inhibition of Tissue Inhibitor of Metalloproteinase 3 (Sorsby fundus dystrophy, pseudoinflammatory) (TIMP3, Accession NM\_000362). Accordingly, utilities of VGAM778 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIMP3. CLONE24945 (Accession NM\_015683) is another VGAM778 host target gene. CLONE24945 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLONE24945, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLONE24945 BINDING SITE, designated SEQ ID:17905, to the nucleotide sequence of VGAM778 RNA, herein designated VGAM RNA, also designated SEQ ID:3489.

[30393] Another function of VGAM778 is therefore inhibition of CLONE24945 (Accession NM\_015683). Accordingly, utili-

ties of VGAM778 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLONE24945. HUMAGCGB (Accession NM\_013286) is another VGAM778 host target gene. HUMAGCGB BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HUMAGCGB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HUMAGCGB BINDING SITE, designated SEQ ID:14956, to the nucleotide sequence of VGAM778 RNA, herein designated VGAM RNA, also designated SEQ ID:3489.

[30394] Another function of VGAM778 is therefore inhibition of HUMAGCGB (Accession NM\_013286). Accordingly, utilities of VGAM778 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HUMAGCGB. KIAA0062 (Accession XM\_046677) is another VGAM778 host target gene. KIAA0062 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0062, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA0062 BINDING SITE, designated SEQ ID:34794, to the nucleotide sequence of VGAM778 RNA, herein designated VGAM RNA, also designated SEQ ID:3489.

[30395] Another function of VGAM778 is therefore inhibition of KIAA0062 (Accession XM\_046677). Accordingly, utilities of VGAM778 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0062. MGC4737 (Accession NM\_031466) is another VGAM778 host target gene. MGC4737 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC4737, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4737 BINDING SITE, designated SEQ ID:25508, to the nucleotide sequence of VGAM778 RNA, herein designated VGAM RNA, also designated SEQ ID:3489.

[30396] Another function of VGAM778 is therefore inhibition of MGC4737 (Accession NM\_031466). Accordingly, utilities of VGAM778 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4737. LOC118611 (Accession XM\_061055) is another VGAM778 host target gene. LOC118611 BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC118611, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC118611 BINDING SITE, designated SEQ ID:37188, to the nucleotide sequence of VGAM778 RNA, herein designated VGAM RNA, also designated SEQ ID:3489.

[30397] Another function of VGAM778 is therefore inhibition of LOC118611 (Accession XM\_061055). Accordingly, utilities of VGAM778 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC118611. LOC146880 (Accession XM\_085627) is another VGAM778 host target gene. LOC146880 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC146880, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146880 BINDING SITE, designated SEQ ID:38261, to the nucleotide sequence of VGAM778 RNA, herein designated VGAM RNA, also designated SEQ ID:3489.

[30398] Another function of VGAM778 is therefore inhibition of

LOC146880 (Accession XM\_085627). Accordingly, utilities of VGAM778 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146880. LOC148811 (Accession XM\_086326) is another VGAM778 host target gene. LOC148811 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148811, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148811 BINDING SITE, designated SEQ ID:38600, to the nucleotide sequence of VGAM778 RNA, herein designated VGAM RNA, also designated SEQ ID:3489.
